

Teaclave TrustZone SDK

<https://teacleve.apache.org>

Mingshen Sun

Security Researcher @ Baidu X-Lab / Teaclave PPMC

Jun 2021

Teaclave

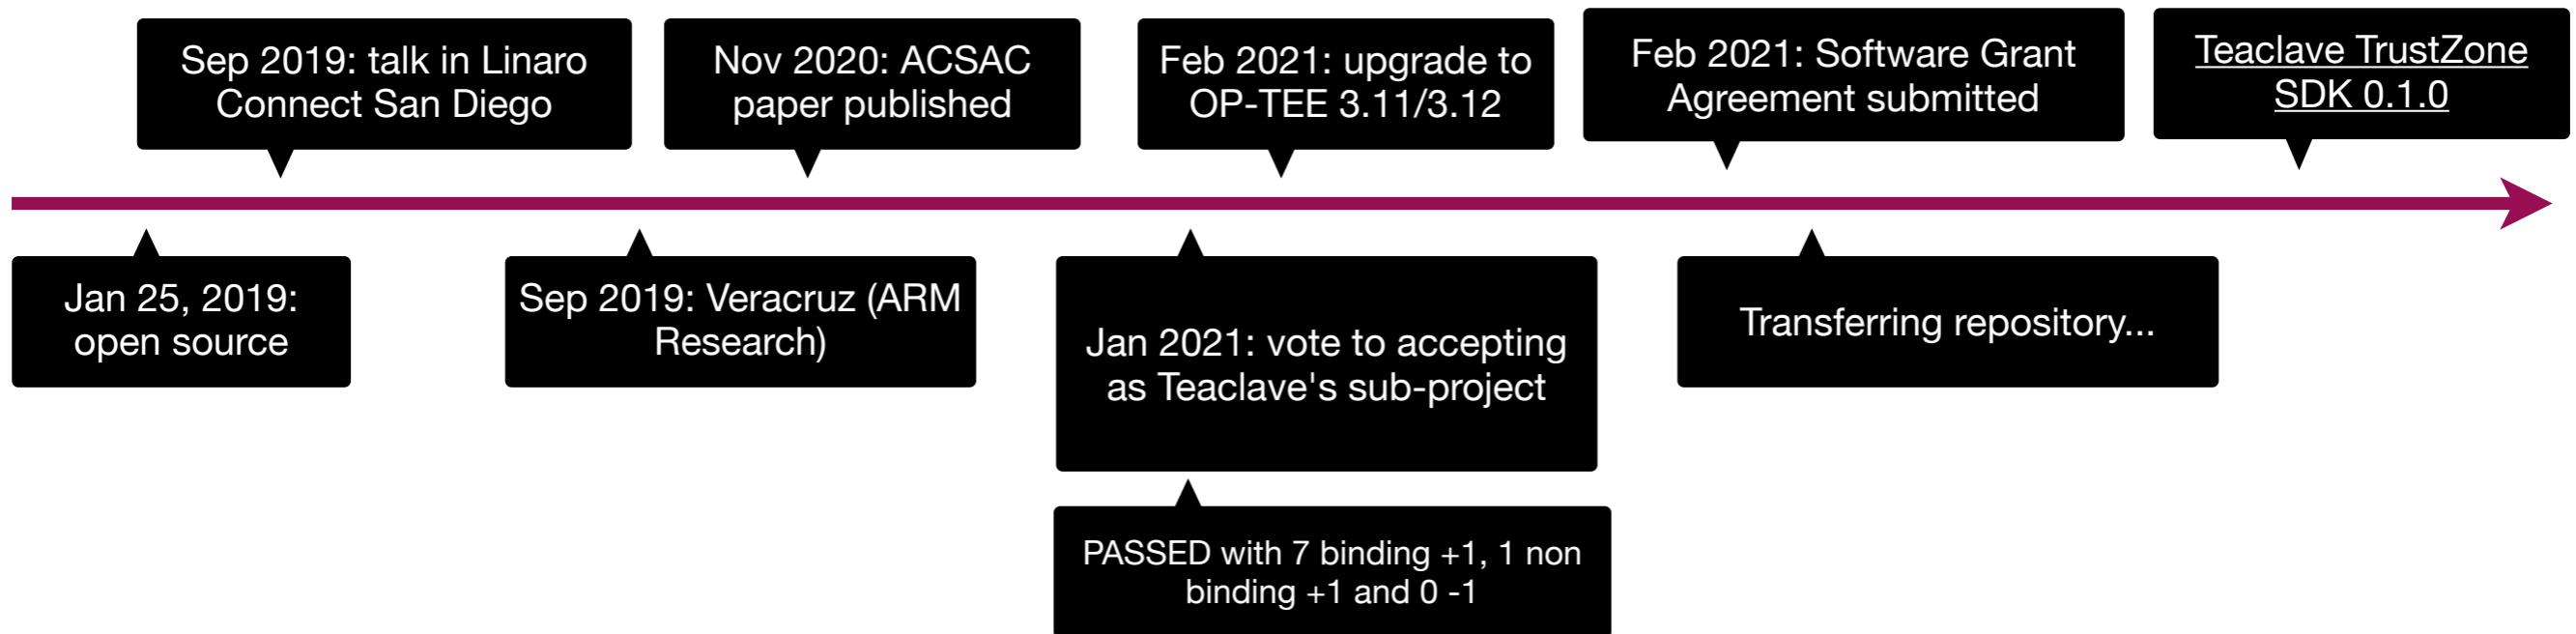

- Apache Teaclave (incubating) is an open source universal secure computing platform, making computation on privacy-sensitive data safe and simple.

A screenshot of the Apache Teaclave (Incubating) website. The header includes the Teaclave logo, a navigation bar with links for About, Powered By, Community, Download, Contributors, Docs, Blog, Repos, and ASF, and a search bar. The main section features a large title "APACHE TEACLAVE (INCUBATING)" and a brief description: "Apache Teaclave (incubating) is an open source universal secure computing platform, making computation on privacy-sensitive data safe and simple." Below this is a green "GET STARTED →" button. The page is divided into four main sections: "SECURE AND ATTESTABLE", "FUNCTION-AS-A-SERVICE", "EASE OF USE", and "FLEXIBLE", each with a subicon and a brief description.

Teaclave

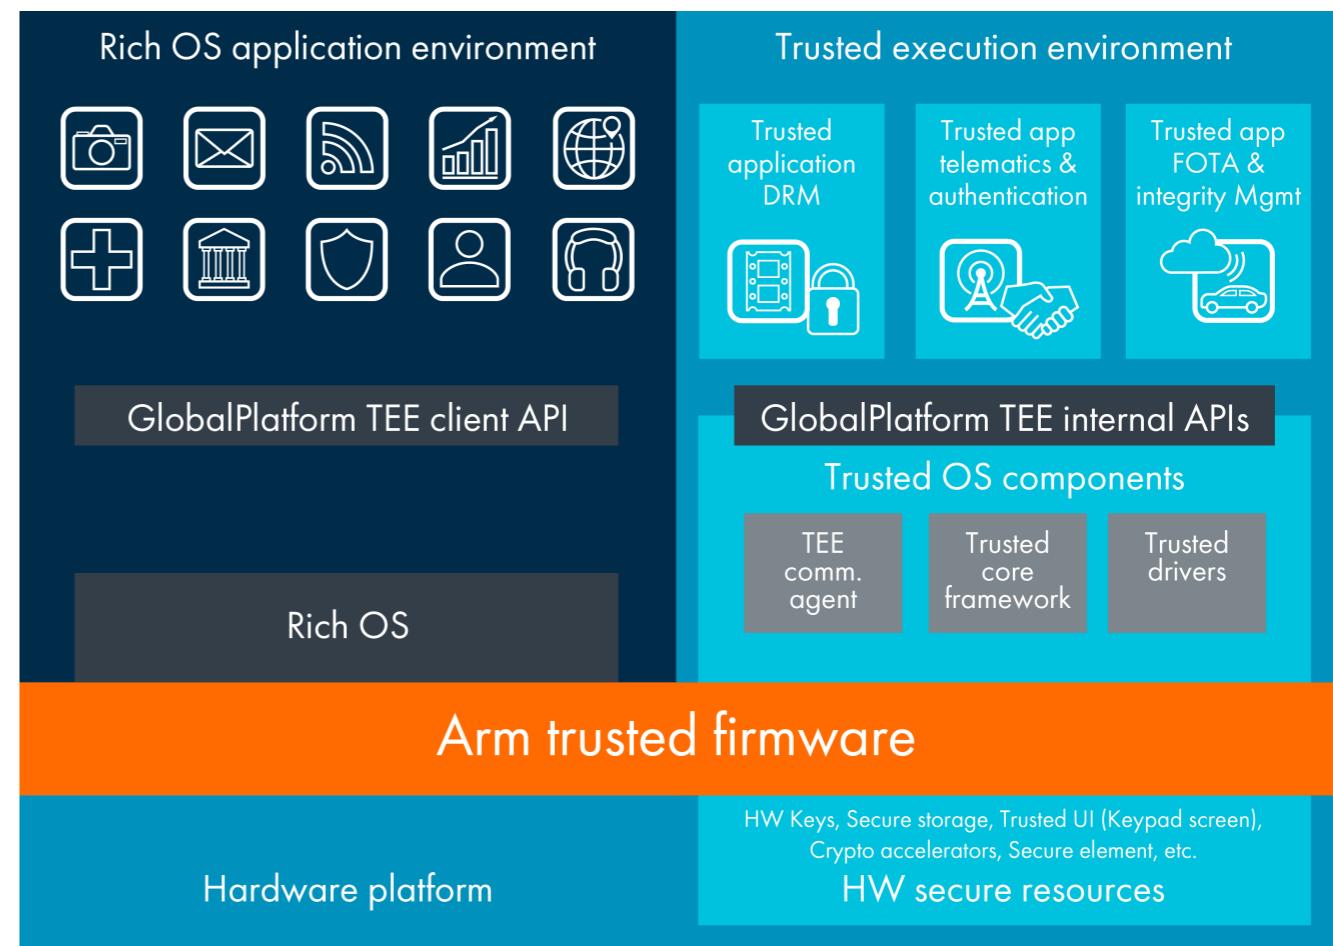

- Apache Teaclave (incubating) is an open source universal secure computing platform, making computation on privacy-sensitive data safe and simple.
 - Originally developed at Baidu as MesaTEE, Rust SGX SDK Rust TrustZone SDK projects.
 - Open source in The Apache Way: Open-source in July 2019 and entered Apache Incubator, using Teaclave as the project name.
 - Homepage: <https://teacleve.apache.org/>
 - Repositories
 - Teaclave Faas Platform: <https://github.com/apache/incubator-teacleve>
 - Teaclave SGX SDK: <https://github.com/apache/incubator-teacleve-sgx-sdk>
 - **Teaclave TrustZone SDK:** <https://github.com/apache/incubator-teacleve-trustzone-sdk>

Teaclave TrustZone SDK Timeline

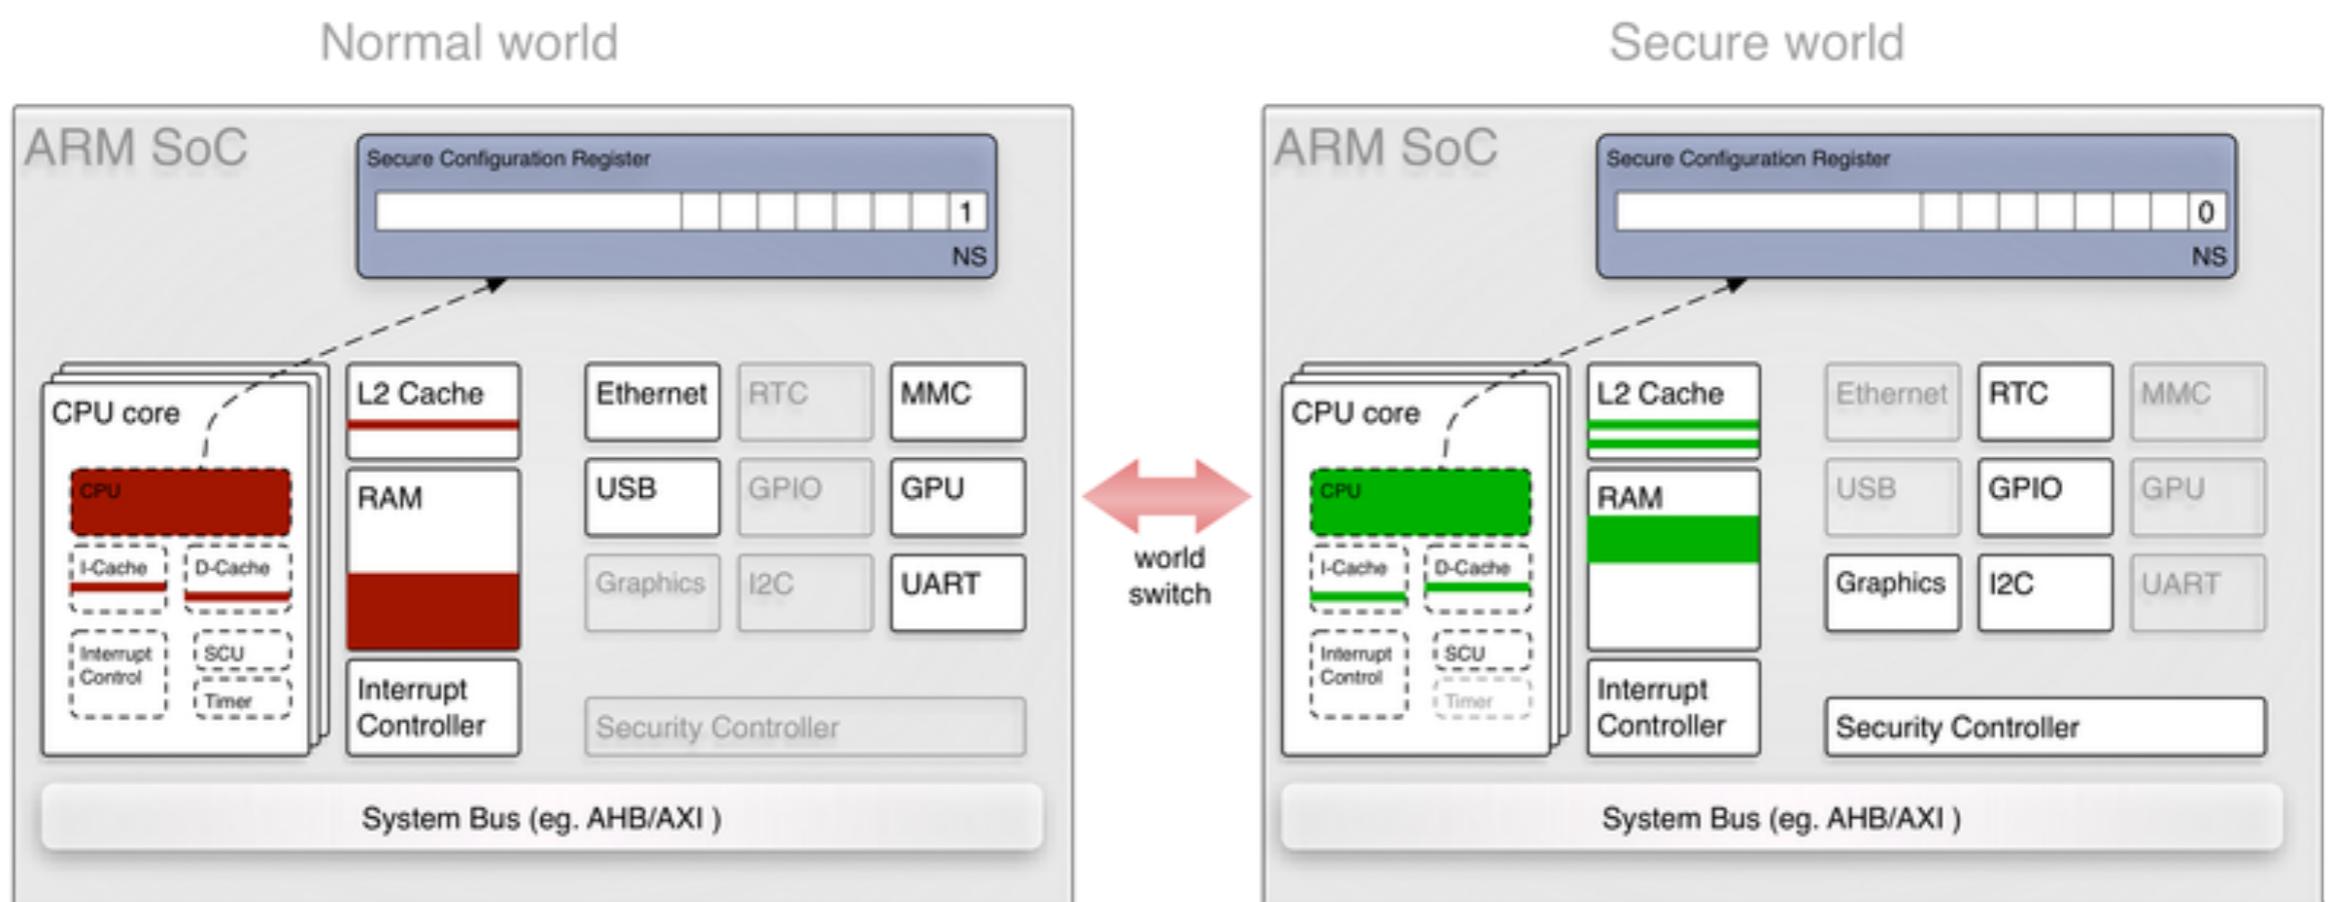

Background

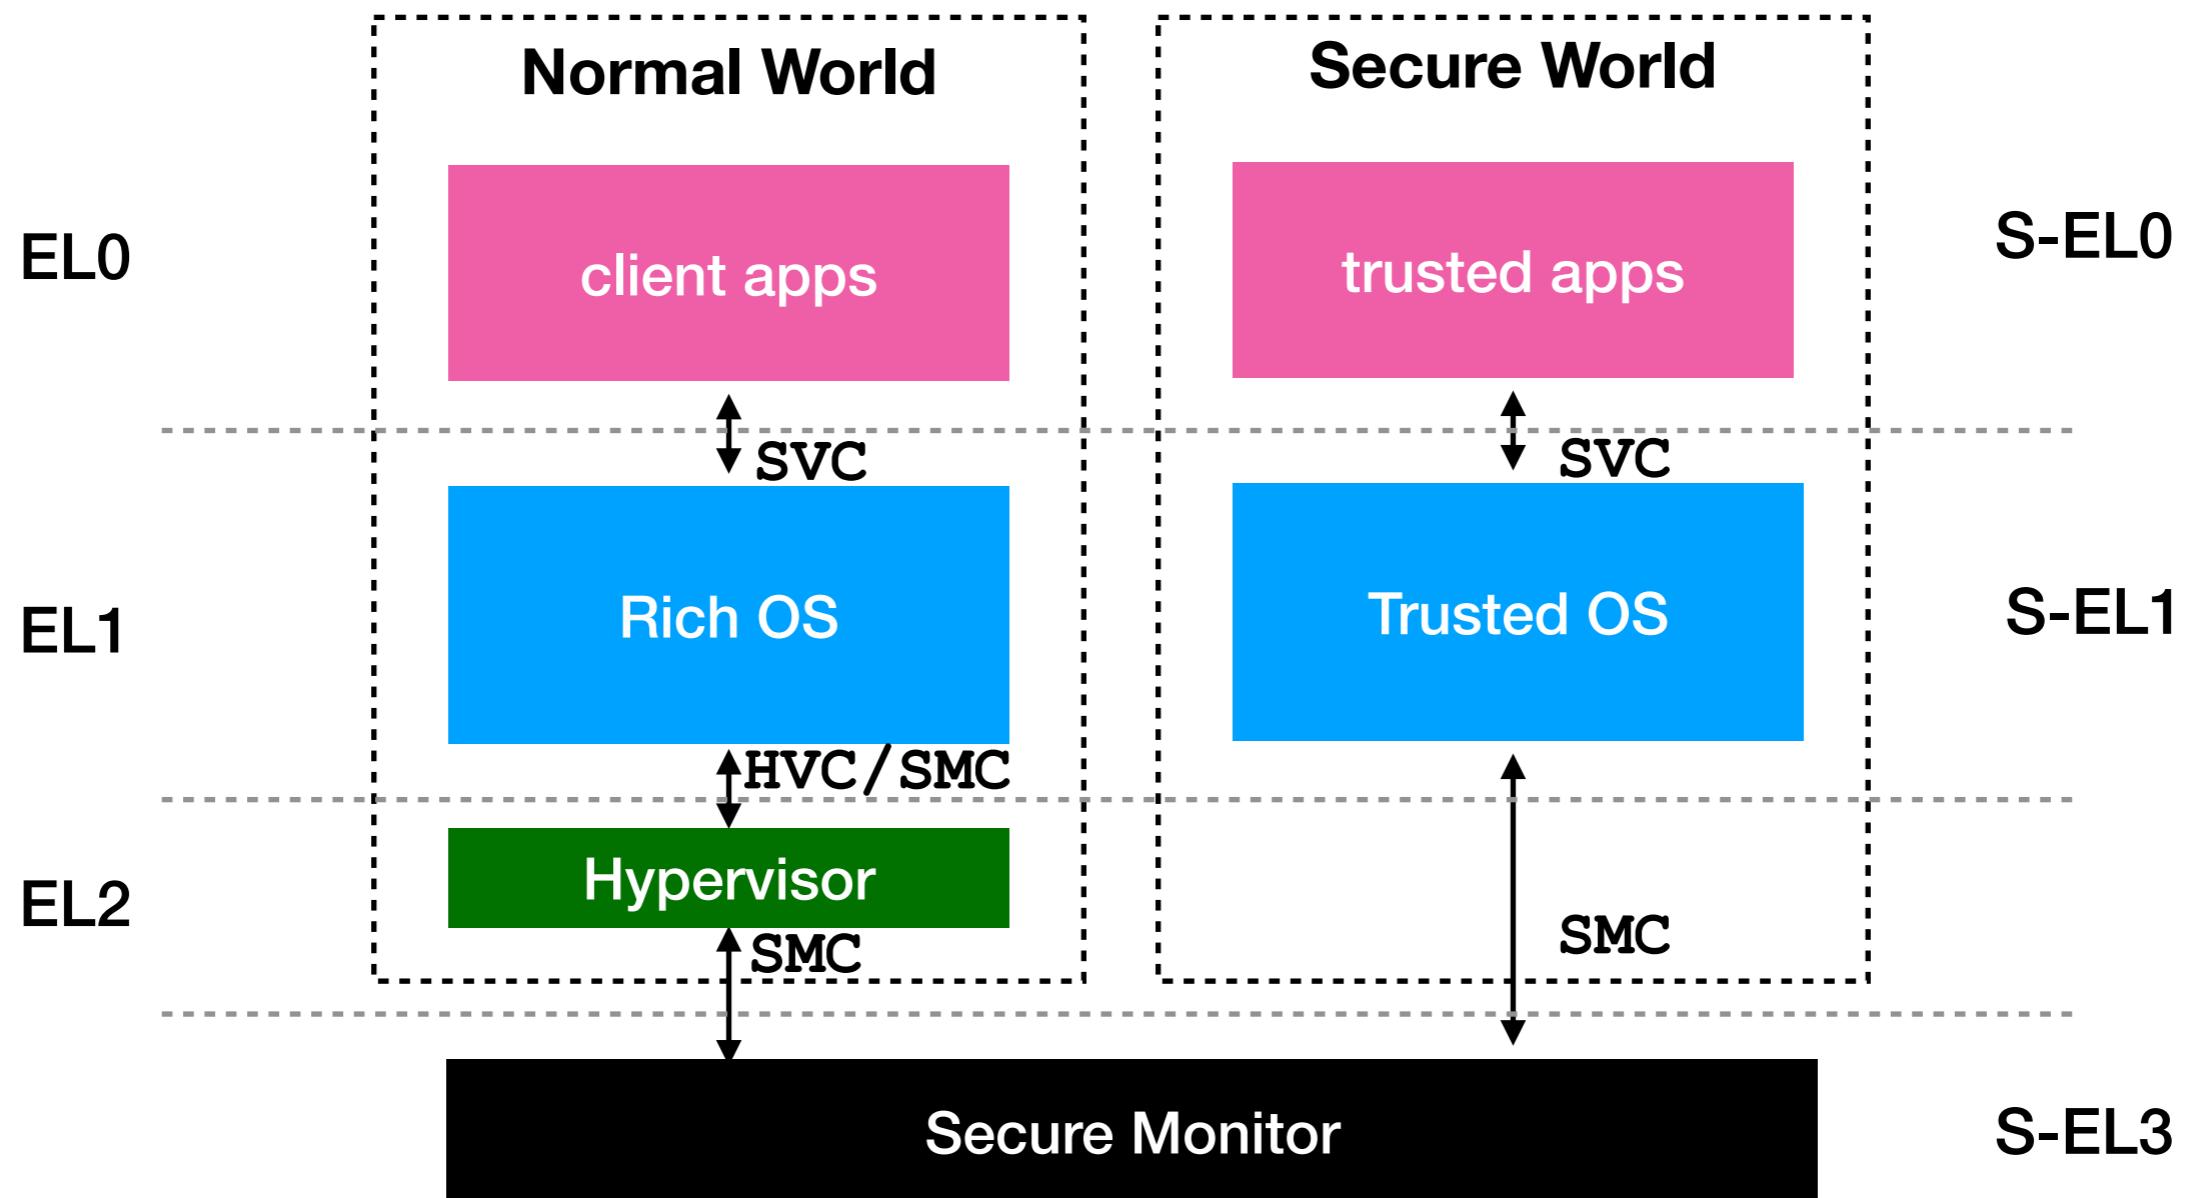

- ARM TrustZone provide ***trusted execution environment*** in mobile phone and embedded devices
- TrustZone secures mobile payment, identification authentication, key management, AI models, DRM, OS integrity, etc.

TrustZone Architecture

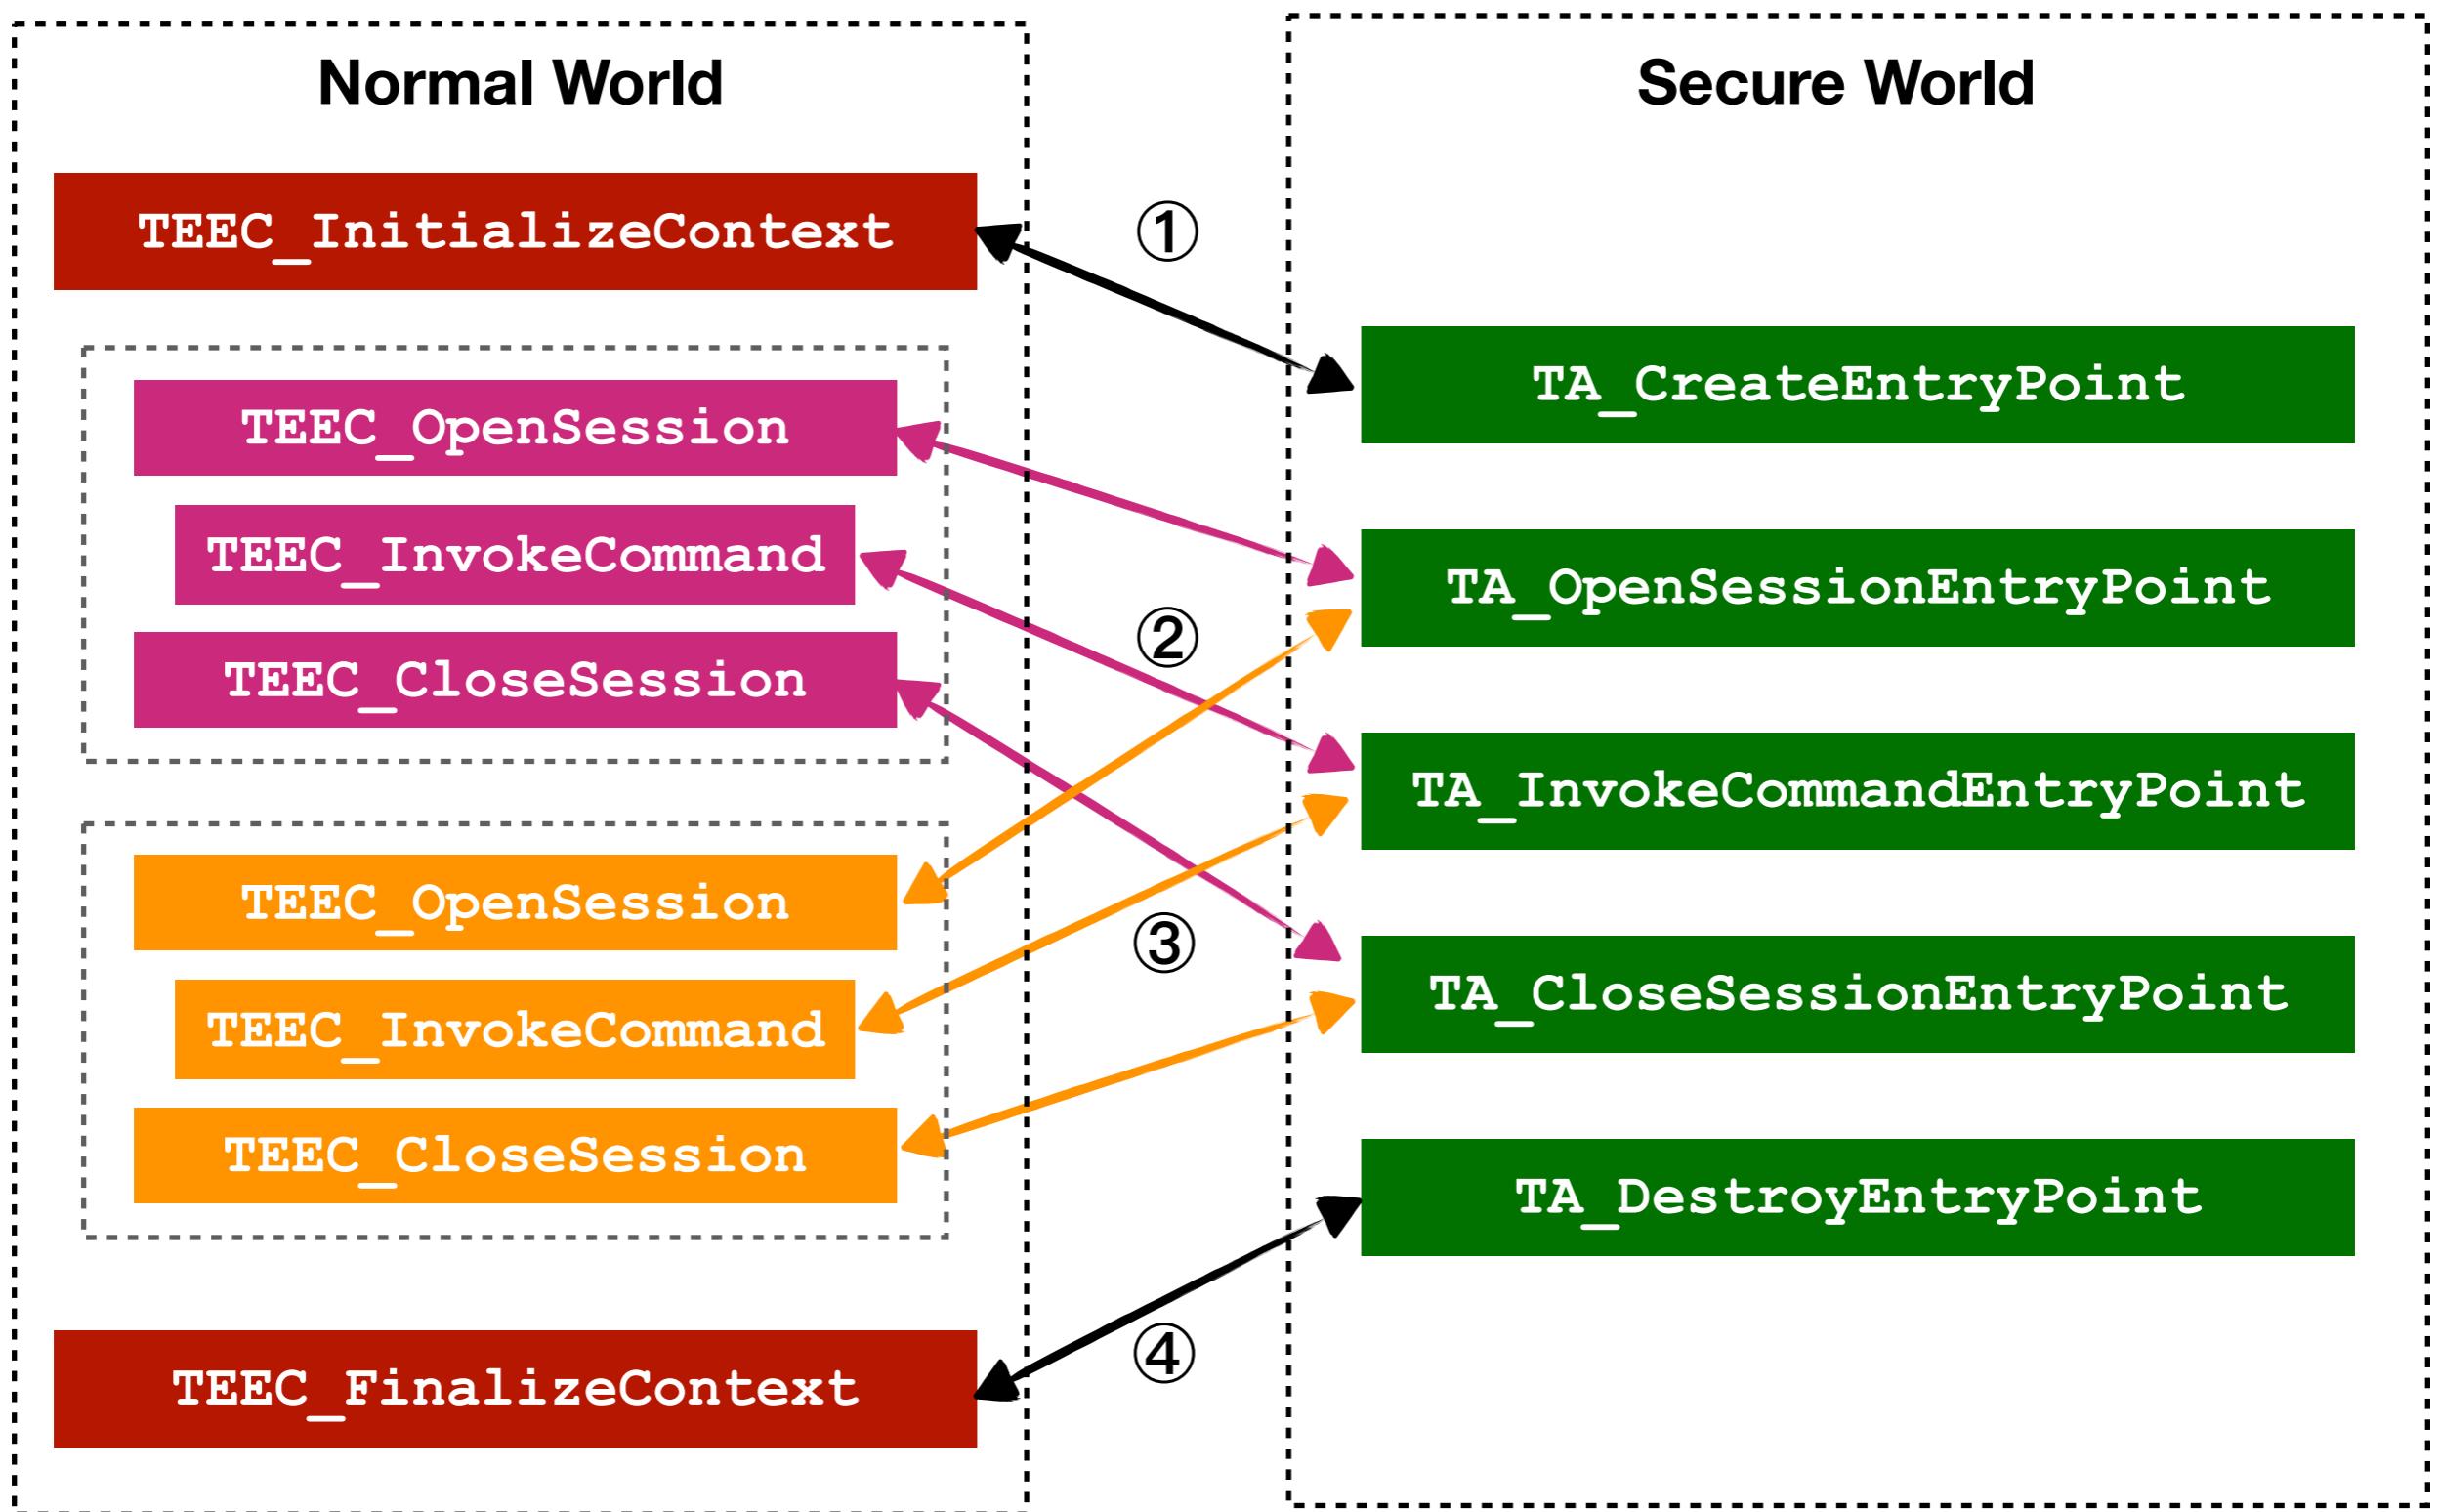

TrustZone Architecture

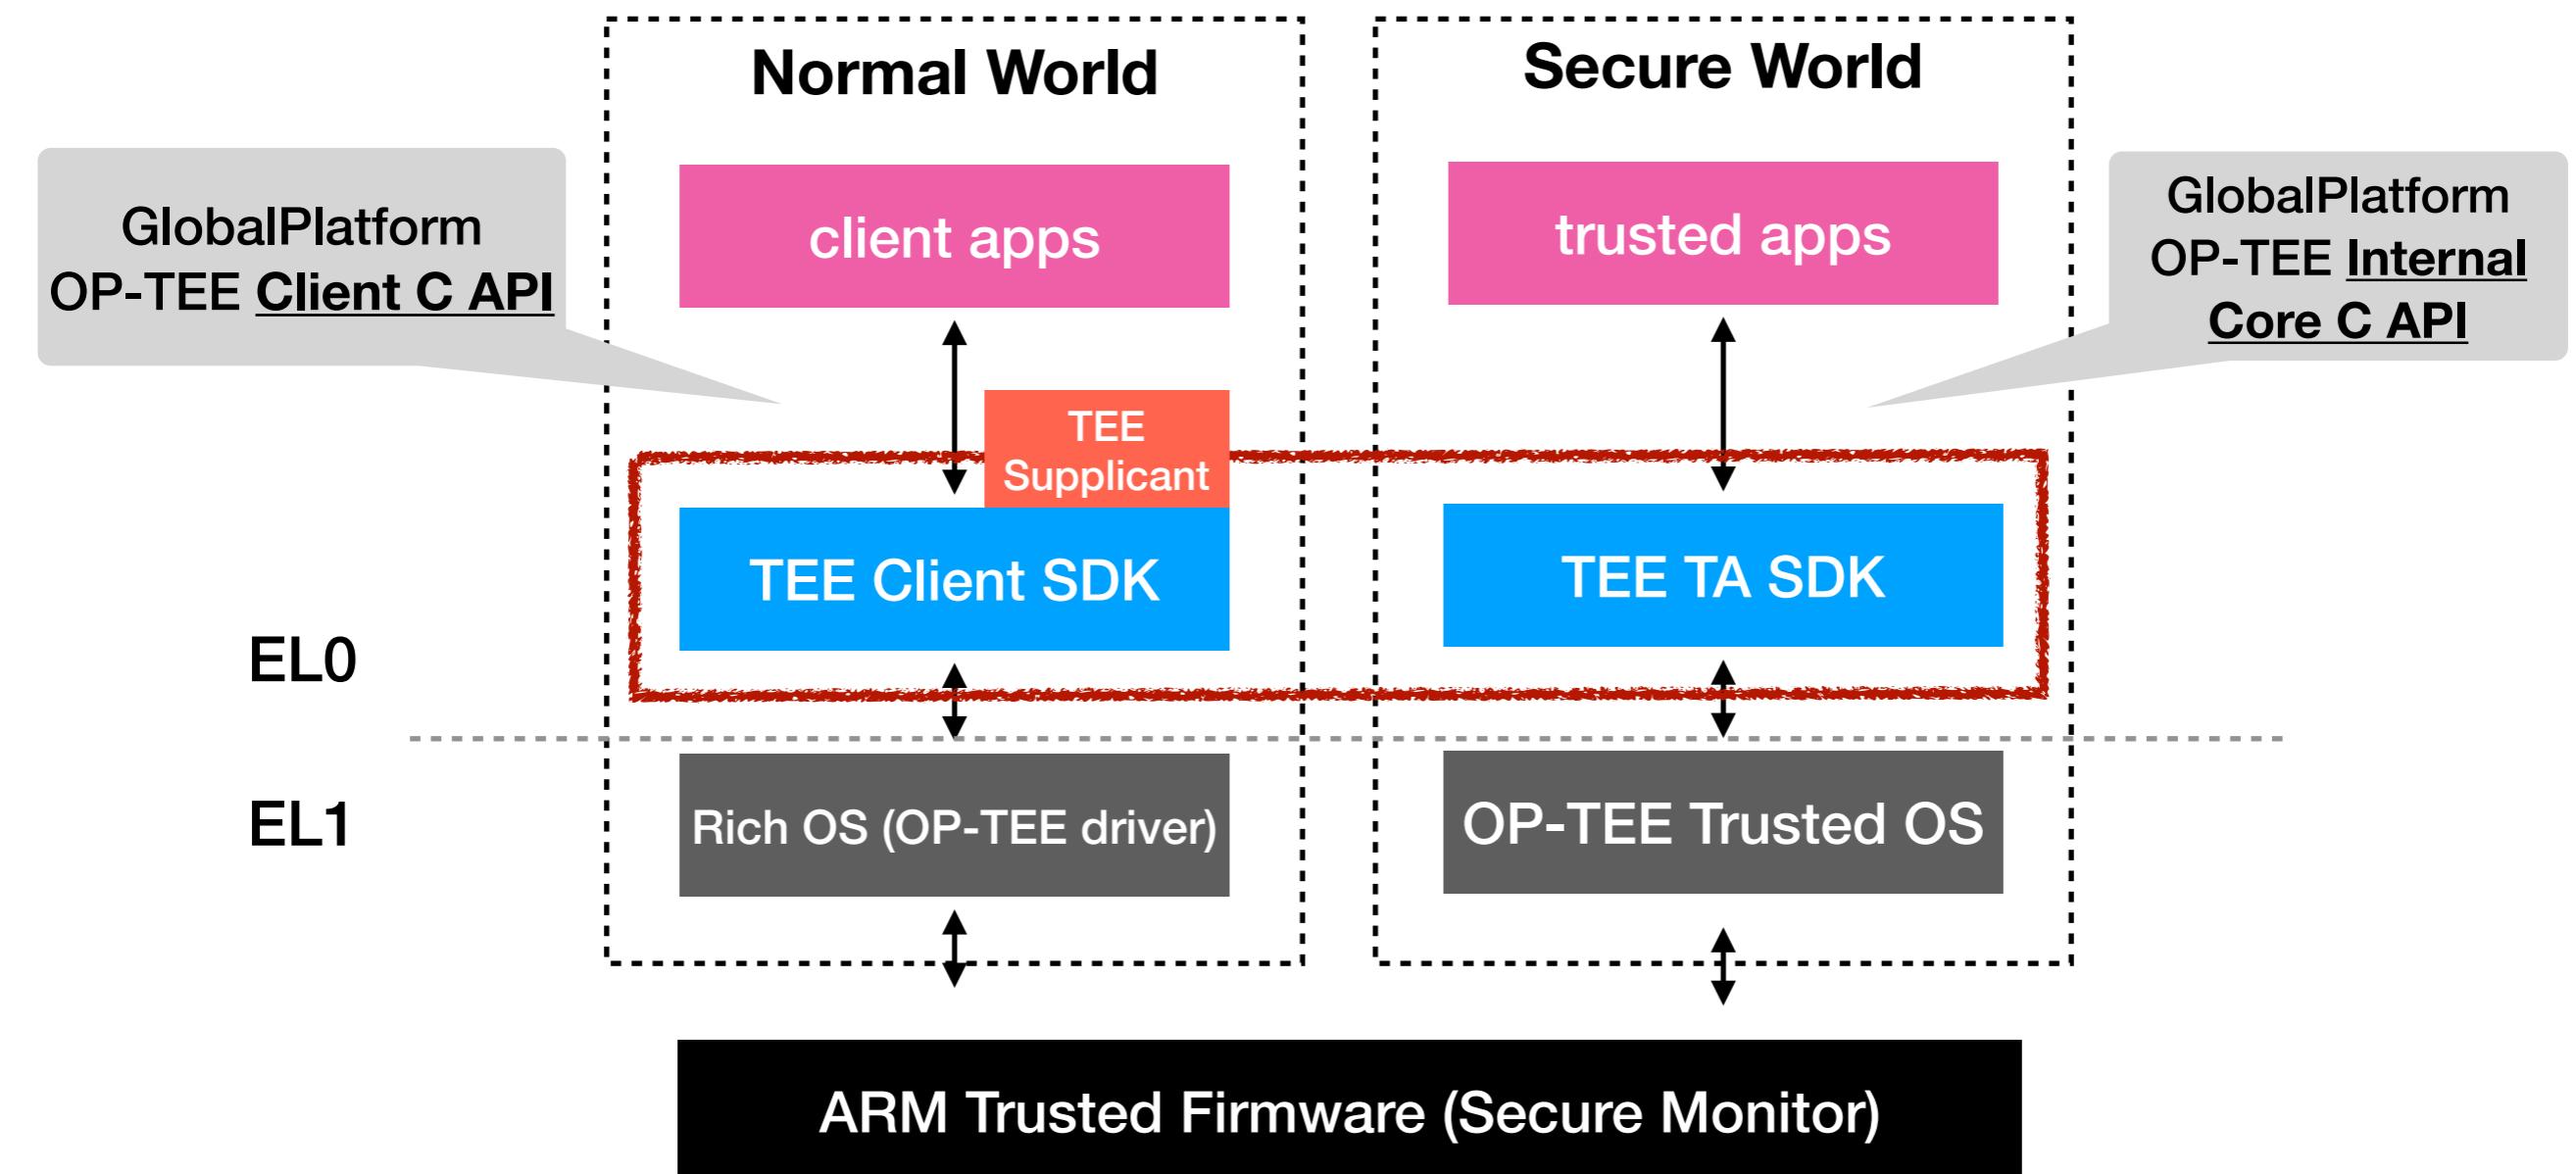

Background

- **GlobalPlatform TEE specifications**
 - *TEE System Architecture (GPD_SPE_009)*: defines a general TEE architecture
 - *TEE Internal Core API Specification (GPD_SPE_010)*
 - *TEE Client API Specification (GPD_SPE_007)*: defines communication interface between Rich OS apps and trusted apps.
- **OP-TEE**: open portable trusted execution environment in compliance with GlobalPlatform specs.

GlobalPlatform TEE API Specification

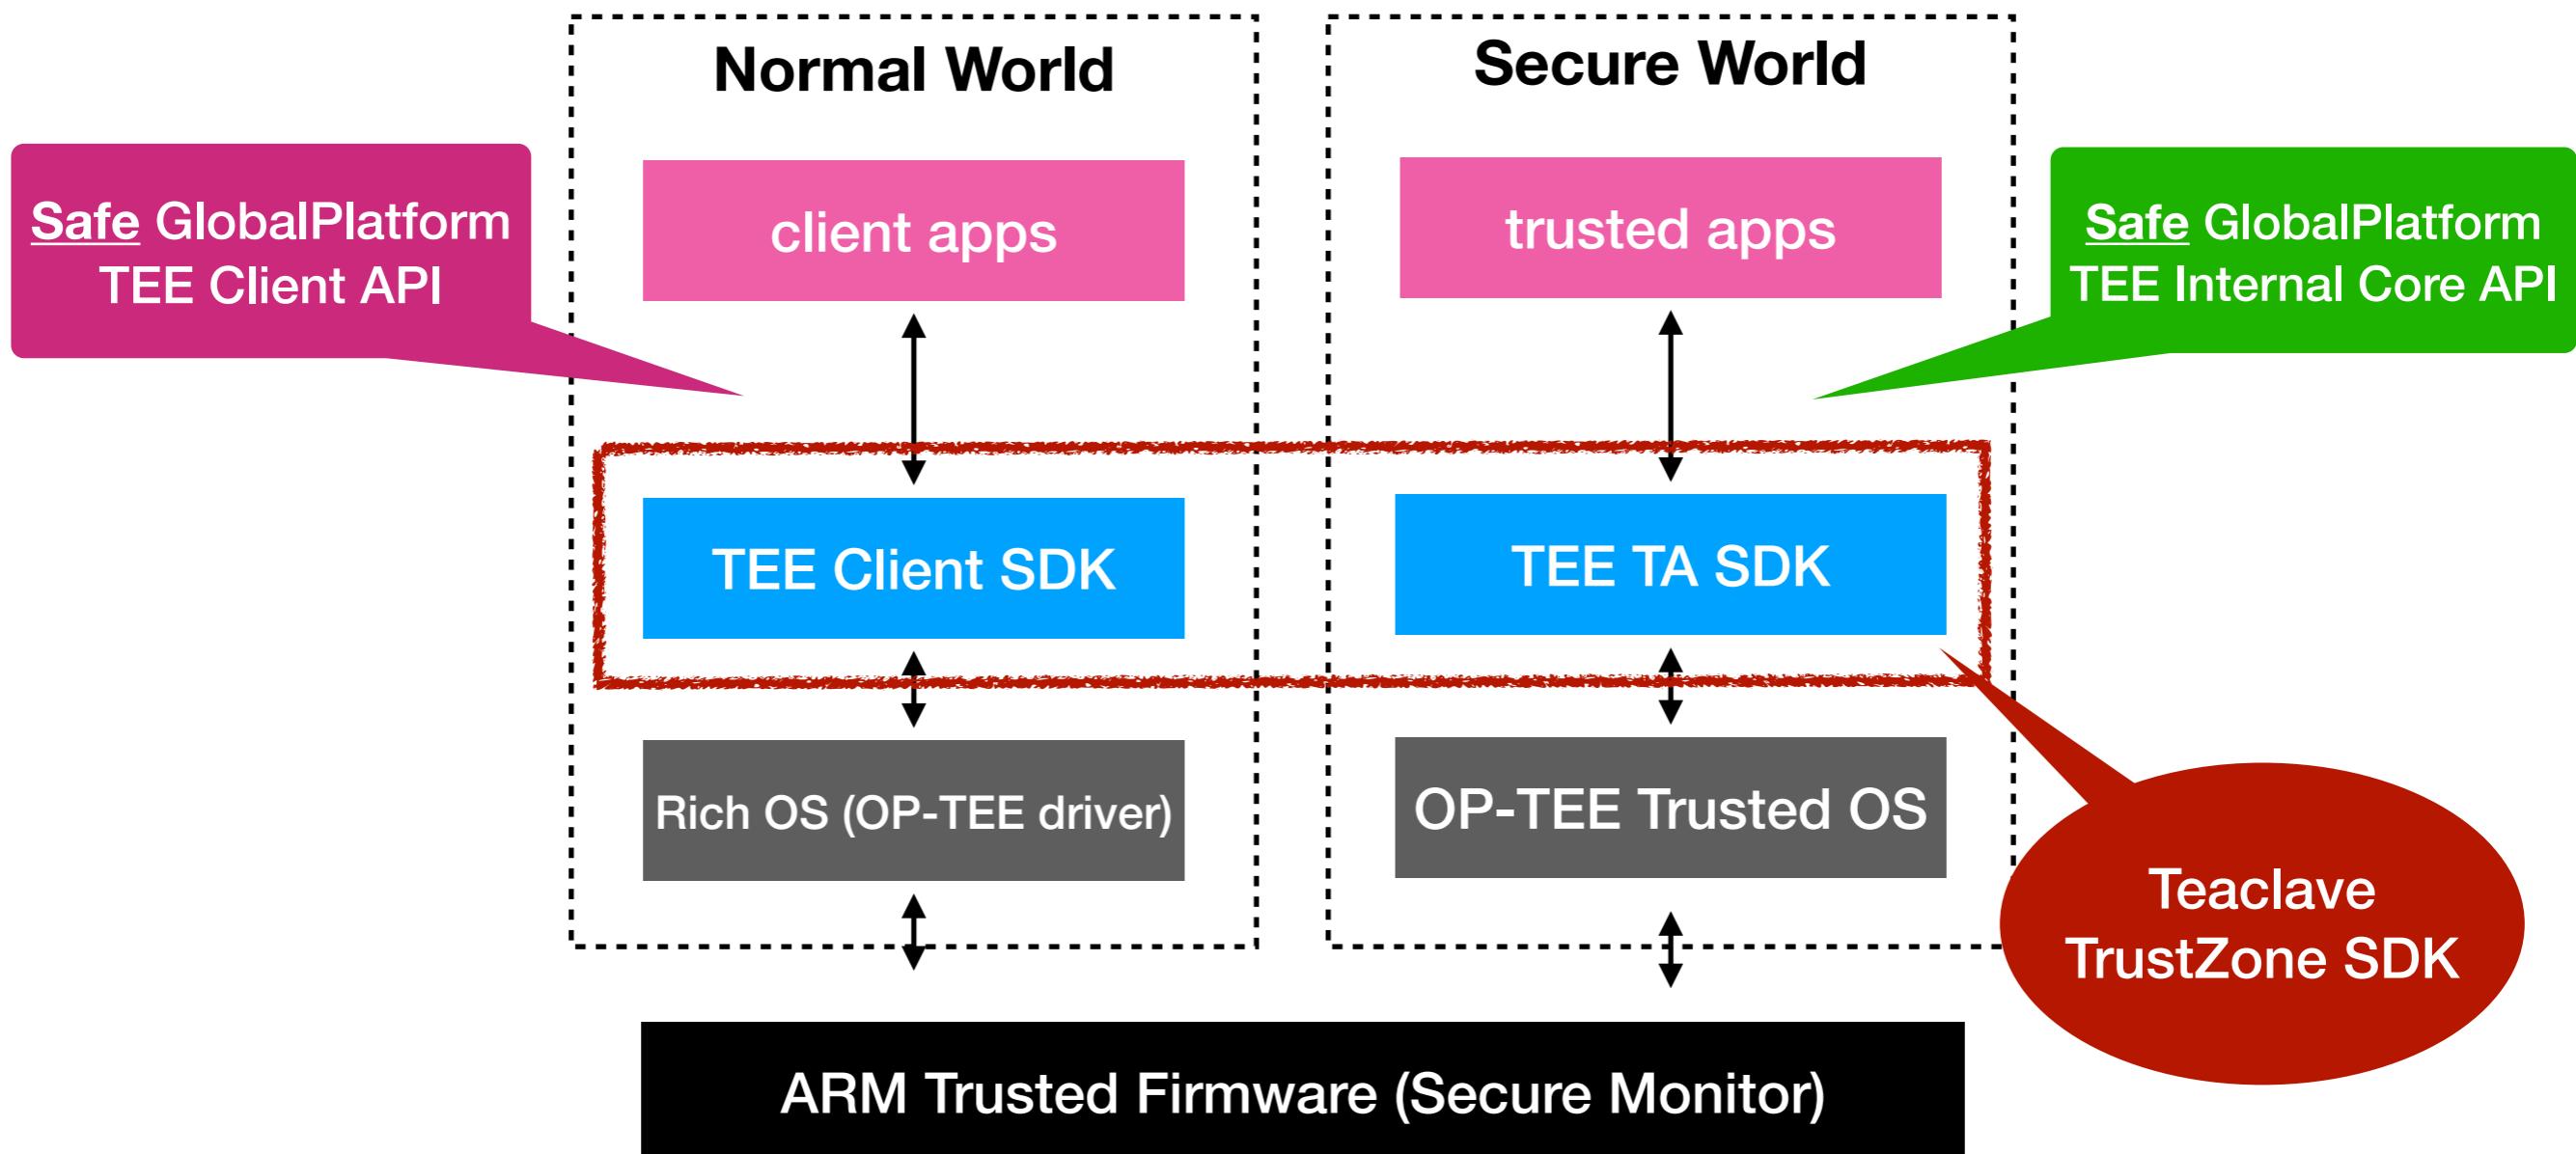

OP-TEE SDK Design

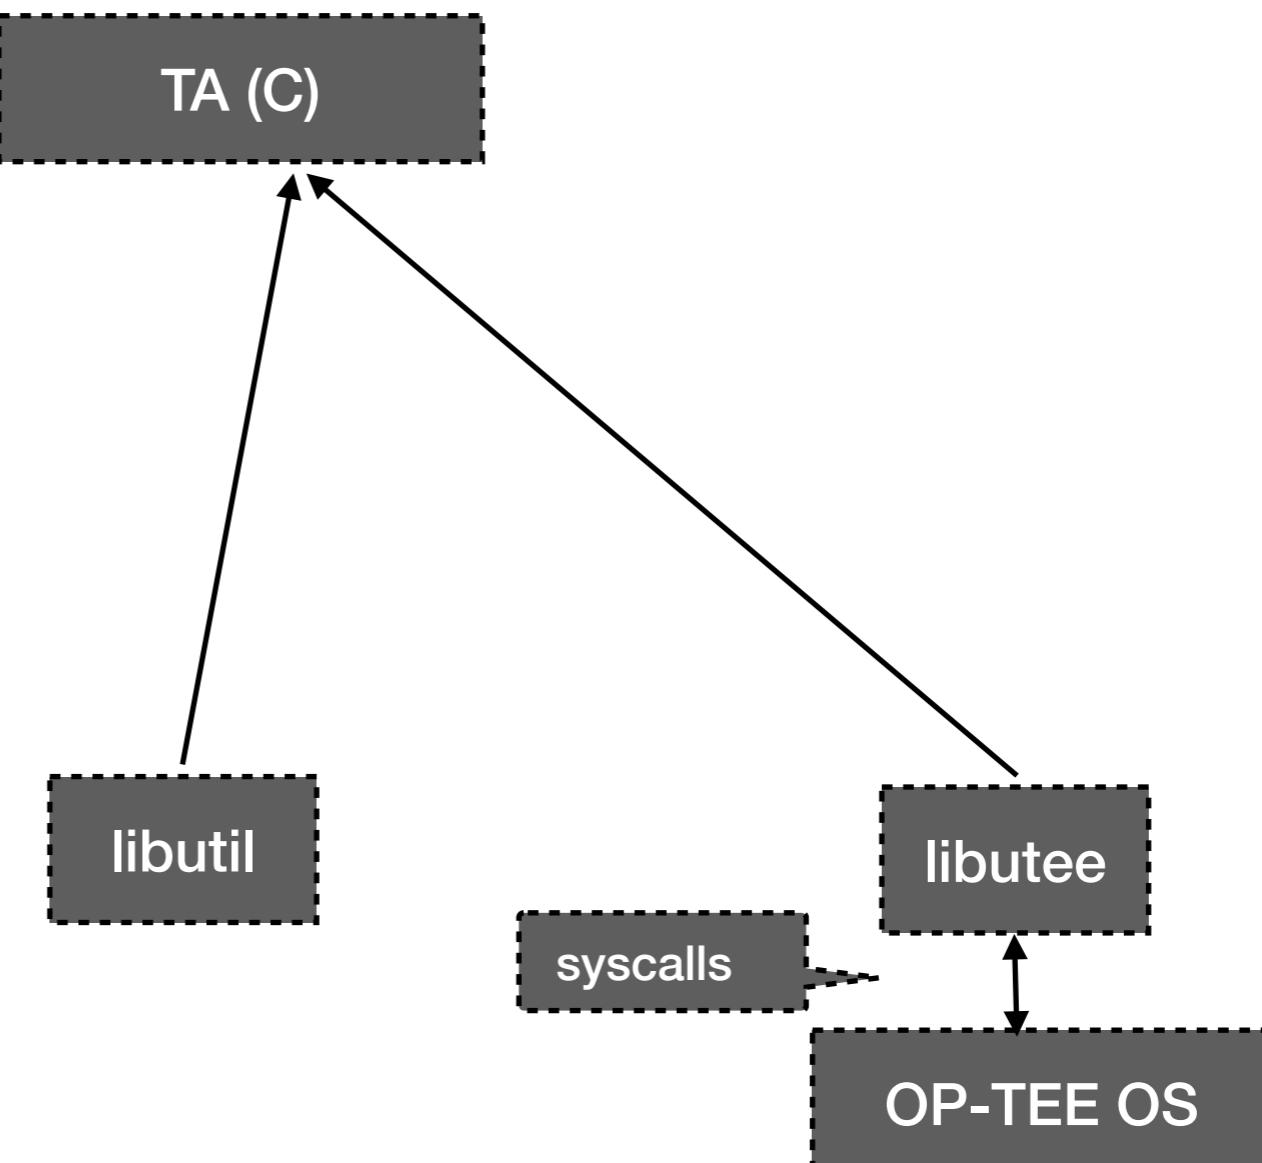

Memory-Safety

- **Memory-safety issues** break security guarantees of TrustZone.
 - Qualcomm's Secure Execution Environment (QSEE) **privilege escalation** vulnerability and exploit (CVE-2015-6639) : <http://bits-please.blogspot.com/2016/05/qsee-privilege-escalation-vulnerability.html>
 - Extracting Qualcomm's KeyMaster Keys - **Breaking Android Full Disk Encryption**: <http://bits-please.blogspot.com/2016/06/extracting-qualcomms-keymaster-keys.html>

Safe SDK Design

Traditional OP-TEE TA Development

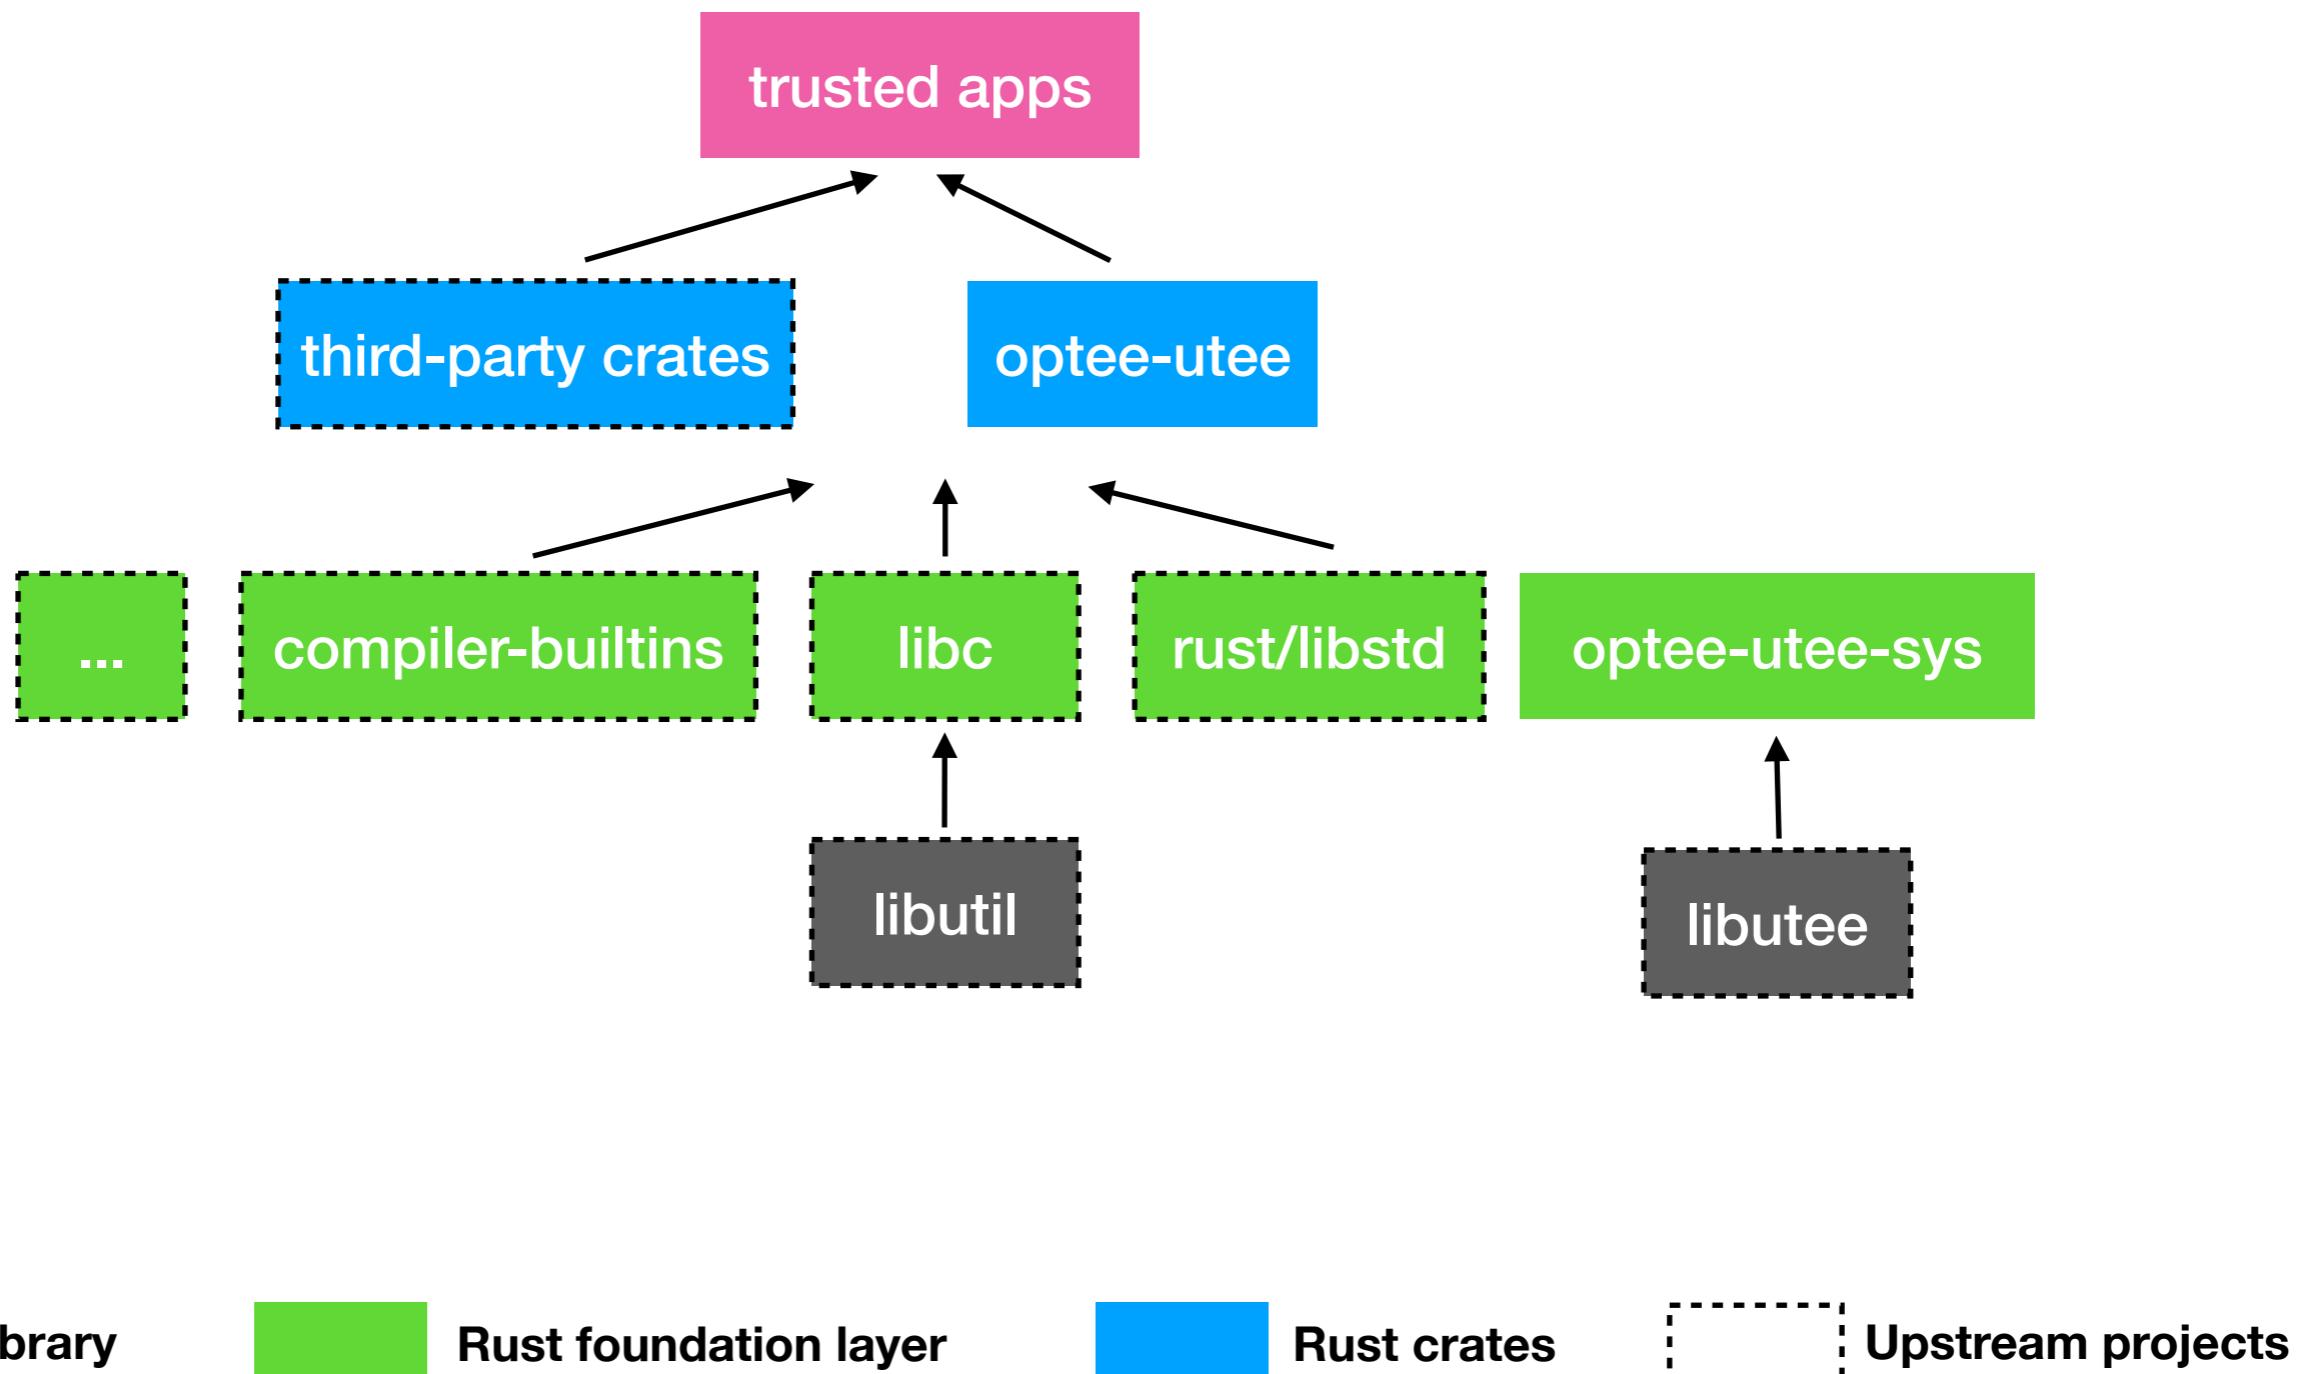

C library

Rust foundation layer

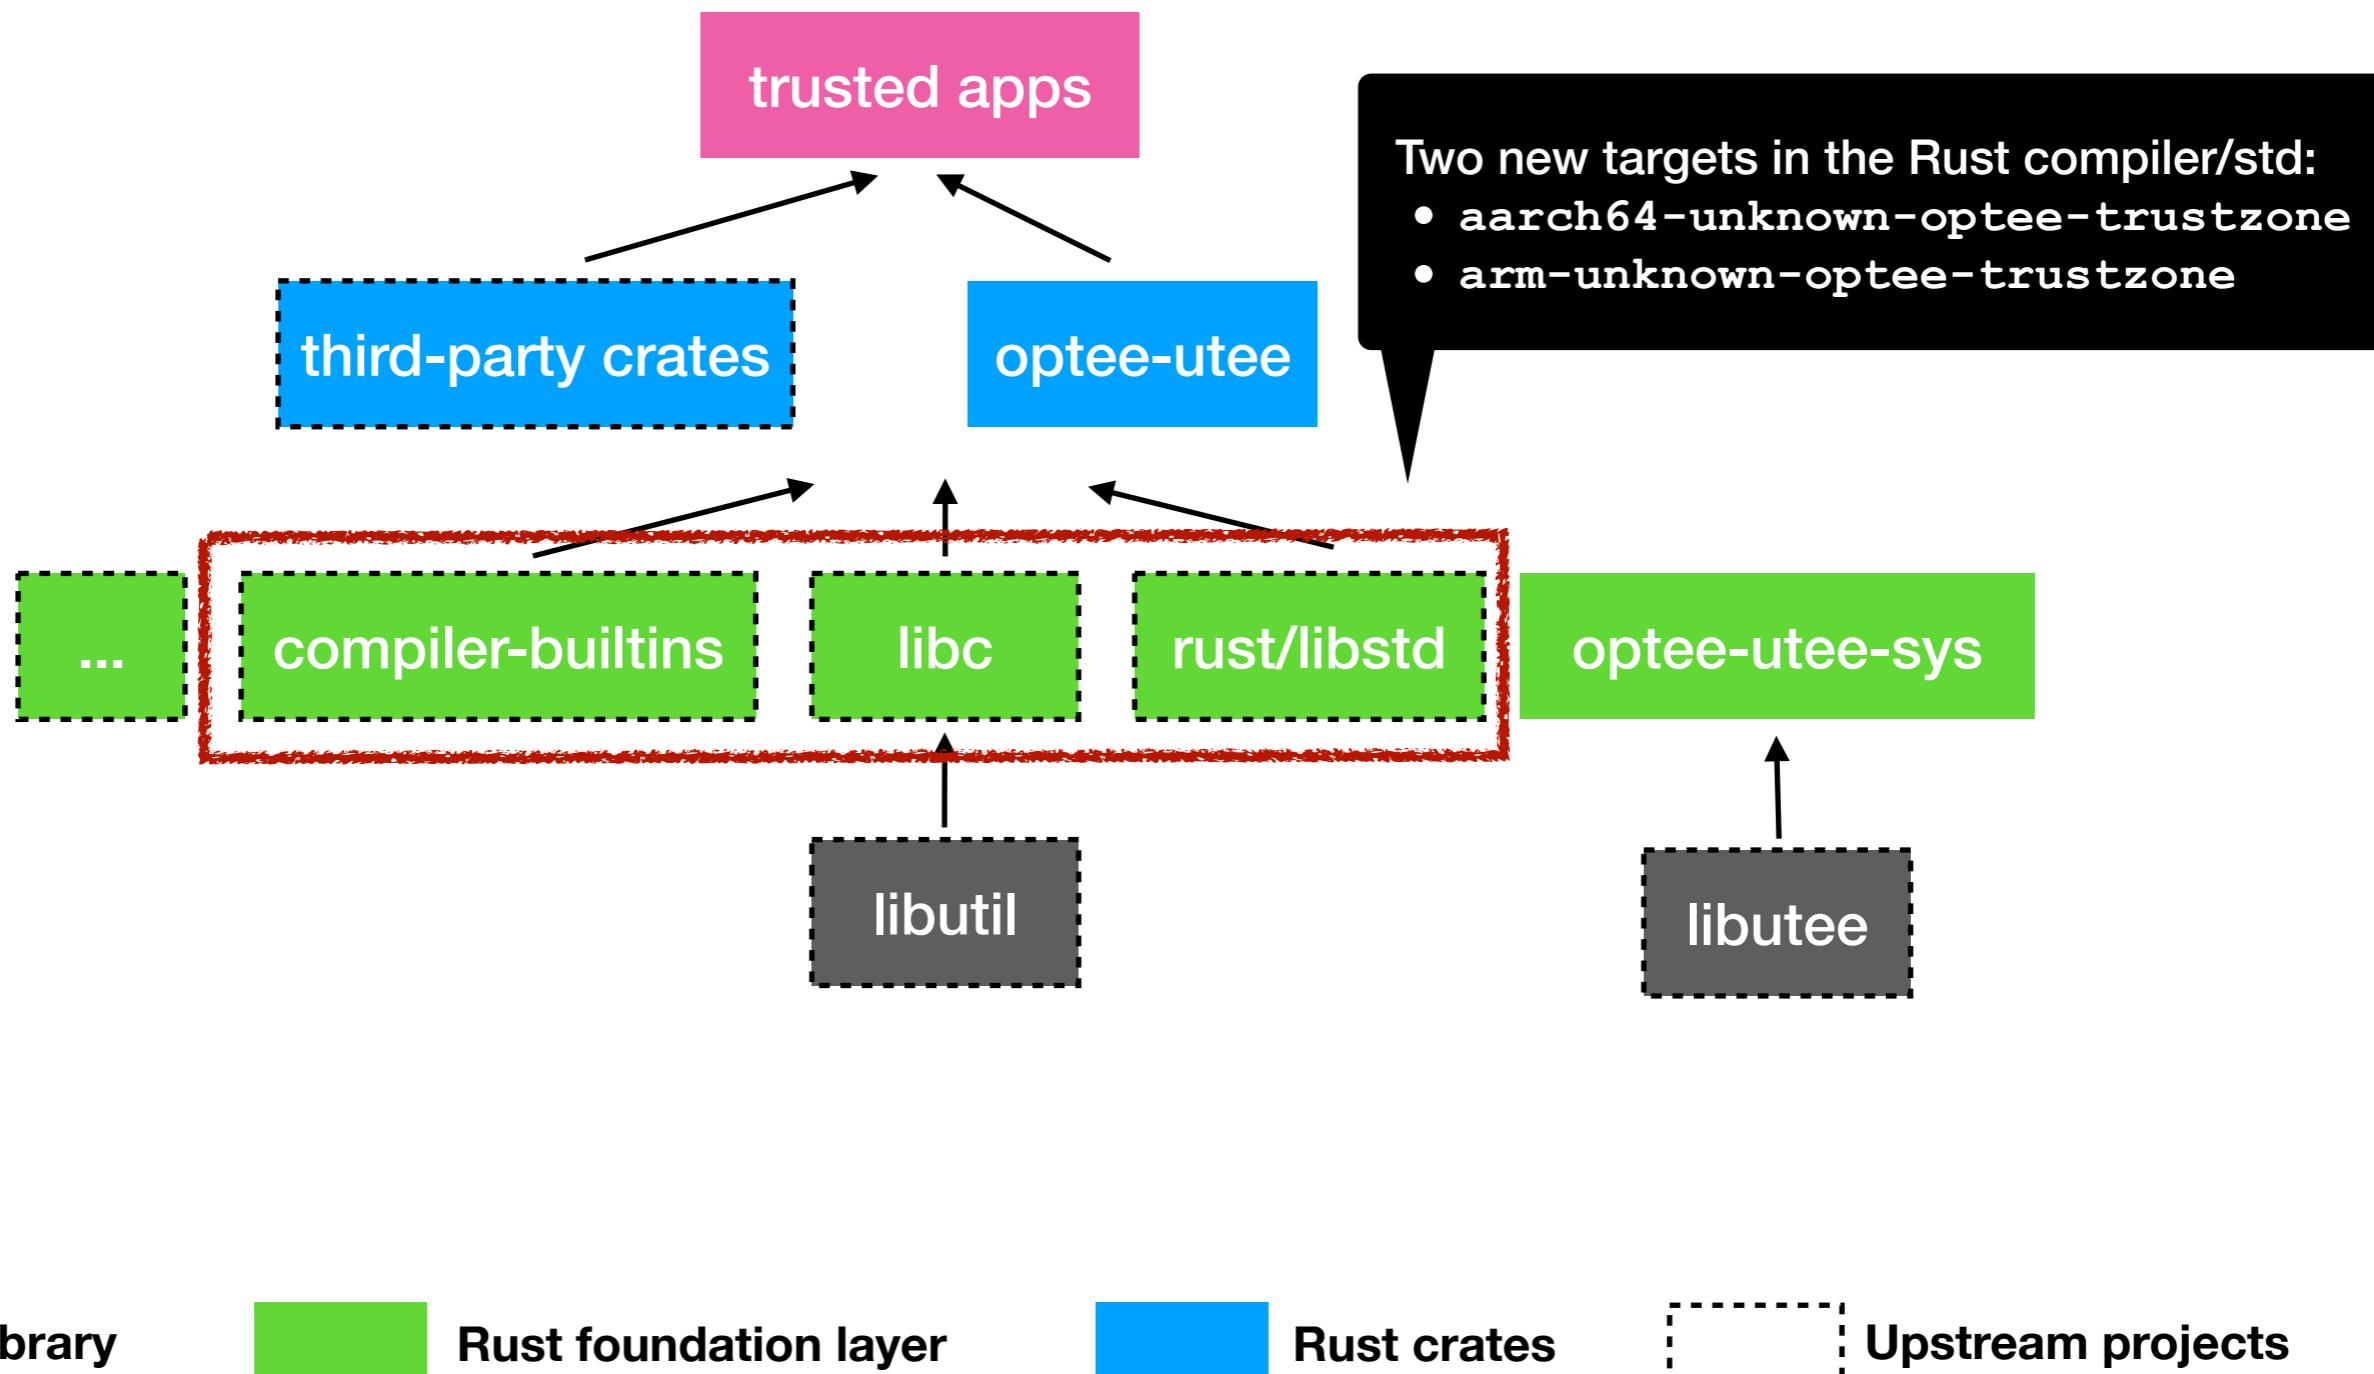

Rust crates

Upstream projects

Design of TA SDK

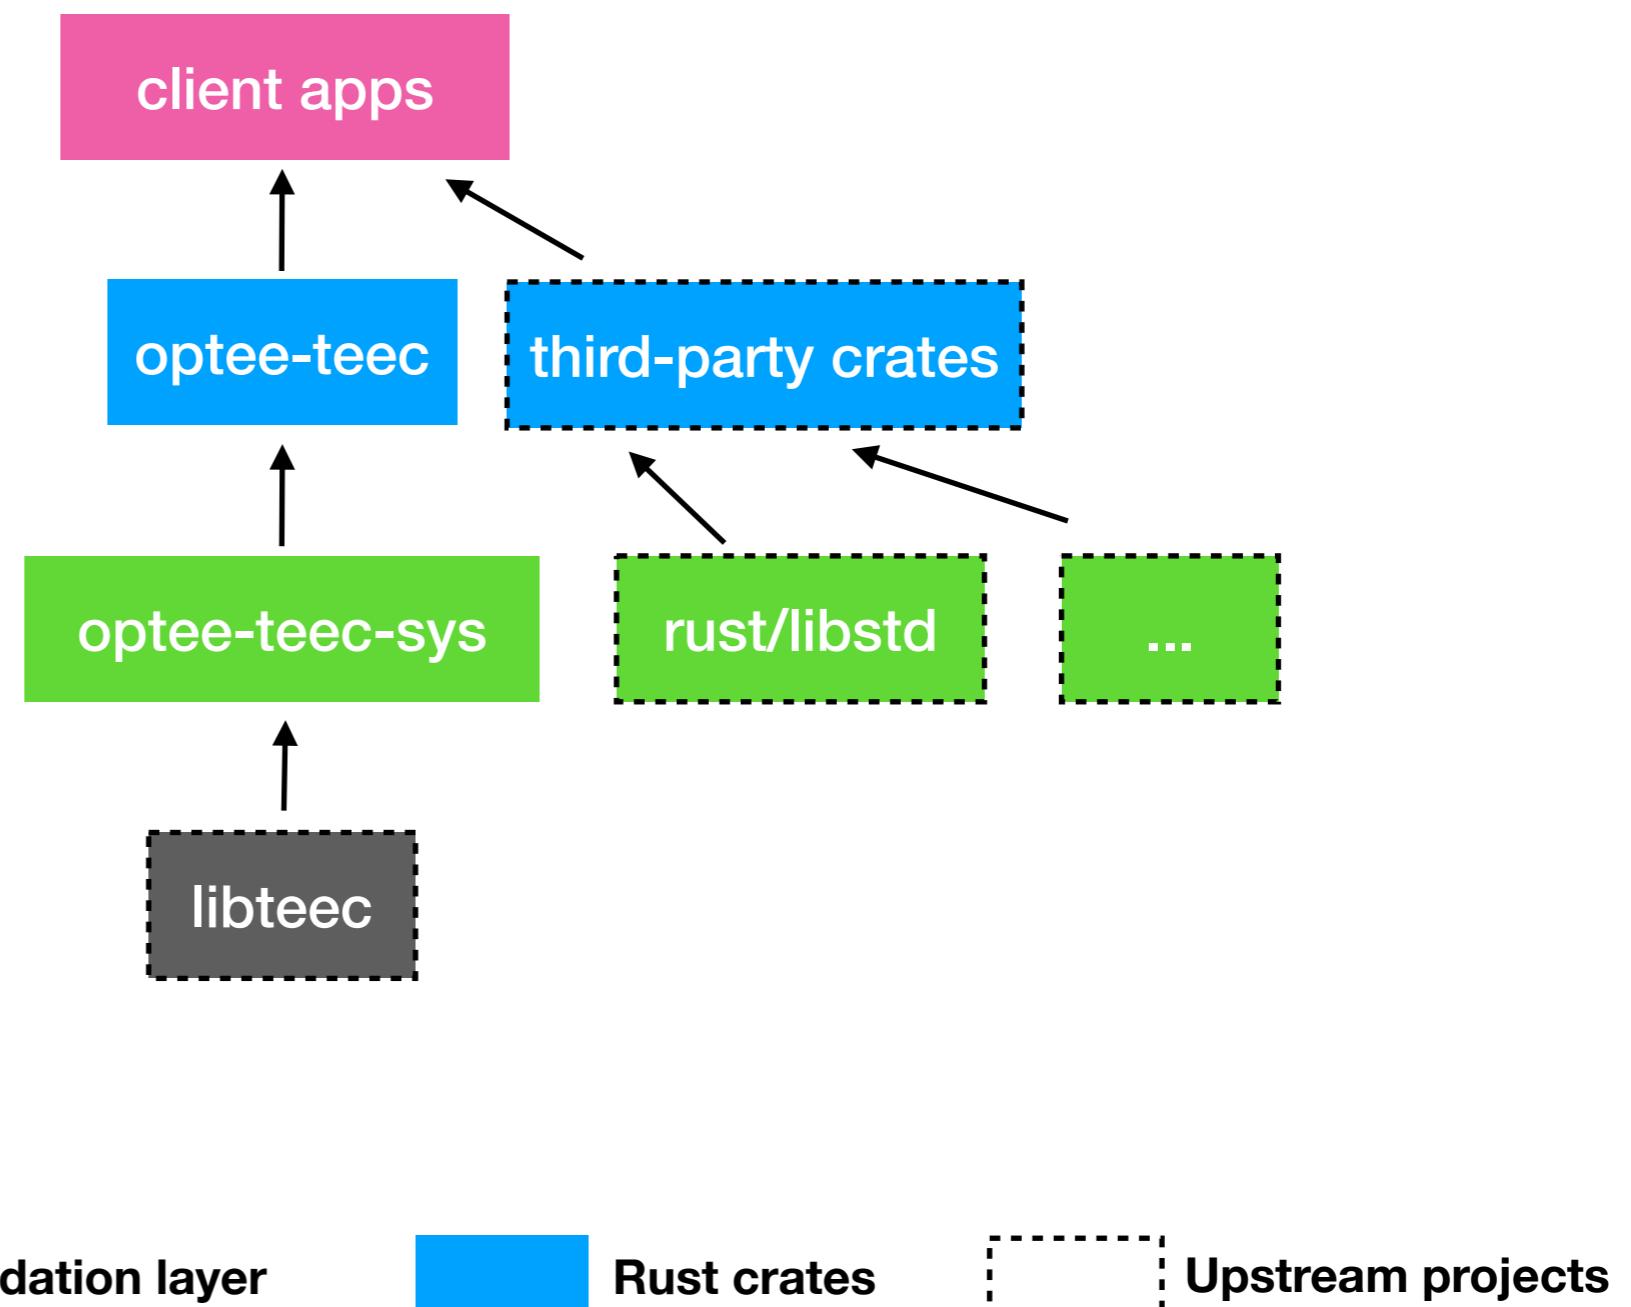

Design of TA SDK

Design of Client SDK

Client apps targets:

- aarch64-unknown-linux-gnu
- arm-unknown-linux-gnu

Project Structure

- **Teaclave TrustZone SDK:** <https://github.com/apache/incubator-teaclave-trustzone-sdk>
- **Rust:** <https://github.com/mesalock-linux/rust>
- **Rust libc:** <https://github.com/mesalock-linux/libc.git>
- **Rust compiler-builtins:** <https://github.com/mesalock-linux/compiler-builtins.git>
- **Wiki:** <https://github.com/apache/incubator-teaclave-trustzone-sdk/wiki>

Project Structure

- **optee-teec**: client-side Rust library
- **optee-utee**: TA-side Rust library
- **optee**: upstream optee library (**optee_client**, **optee_os**)
- **rust**: modified Rust including
 - **rust**: ~29 files changed, 1800 insertions
 - **libc**: ~4 files changed, 131 insertions
 - **compiler-builtins**: ~3 files changed, 3 insertions(+), 1 deletion(-)
- **examples**: acipher, aes, authentication, big_int, diffie_hellman, digest, hello_world, hotp, message_passing_interface, random, secure_storage, serde, and time

Current optee-teec and optee-utee crate

- context.rs
- error.rs
- operation.rs
- parameter.rs
- session.rs
- uuid.rs
- arithmetical.rs
- crypto_op.rs
- error.rs
- object.rs
- parameter.rs
- time.rs
- trace.rs
- lib.rs and macros.rs

Project Structure - rust/libstd

`src/librustc_target/spec/aarch64_unknown_optee_trustzone.rs`

`src/libstd/sys/optee/alloc.rs`
`src/libstd/sys/optee/args.rs`
`src/libstd/sys/optee/backtrace.rs`
`src/libstd/sys/optee/cmath.rs`
`src/libstd/sys/optee/condvar.rs`
`src/libstd/sys/optee/env.rs`
`src/libstd/sys/optee/fs.rs`
`src/libstd/sys/optee/io.rs`
`src/libstd/sys/optee/memchr.rs`
`src/libstd/sys/optee/mod.rs`
`src/libstd/sys/optee/mutex.rs`

`src/libstd/sys/optee/net.rs`
`src/libstd/sys/optee/os.rs`
`src/libstd/sys/optee/os_str.rs`
`src/libstd/sys/optee/path.rs`
`src/libstd/sys/optee/pipe.rs`
`src/libstd/sys/optee/process.rs`
`src/libstd/sys/optee/rwlock.rs`
`src/libstd/sys/optee/stack_overflow.rs`
`src/libstd/sys/optee/stdio.rs`
`src/libstd/sys/optee/thread.rs`
`src/libstd/sys/optee/thread_local.rs`
`src/libstd/sys/optee/time.rs`

Example: alloc.rs

```
1  use crate::libc;
2  use crate::alloc::{GlobalAlloc, Layout, System};
3
4  #[stable(feature = "alloc_system_type", since = "1.28.0")]
5  unsafe impl GlobalAlloc for System {
6      #[inline]
7      unsafe fn alloc(&self, layout: Layout) -> *mut u8 {
8          libc::malloc(layout.size()) as *mut u8
9      }
10
11     #[inline]
12     unsafe fn alloc_zeroed(&self, layout: Layout) -> *mut u8 {
13         libc::calloc(layout.size(), 1) as *mut u8
14     }
15
16     #[inline]
17     unsafe fn dealloc(&self, ptr: *mut u8, _layout: Layout) {
18         libc::free(ptr as *mut libc::c_void)
19     }
20
21     #[inline]
22     unsafe fn realloc(&self, ptr: *mut u8, _layout: Layout, new_size: usize) -> *mut u8 {
23         libc::realloc(ptr as *mut libc::c_void, new_size) as *mut u8
24     }
25 }
```

The underlying library of libc is
libutil from OP-TEE

Example: thread.rs

```
1 use crate::boxed::FnBox;
2 use crate::ffi::CStr;
3 use crate::io;
4 use crate::sys::{unsupported, Void};
5 use crate::time::Duration;
6
7 pub struct Thread(Void);
8
9 pub const DEFAULT_MIN_STACK_SIZE: usize = 4096;
10
11 impl Thread {
12     // unsafe: see thread::Builder::spawn_unchecked for safety requirements
13     pub unsafe fn new(_stack: usize, _p: Box<dyn FnBox()>)
14         -> io::Result<Thread>
15     {
16         unsupported()
17     }
18
19     pub fn yield_now() {
20         panic!("unsupported")
21     }
22
23     pub fn set_name(_name: &CStr) {
24         panic!("unsupported")
25     }
26
27     pub fn sleep(_dur: Duration) {
28         panic!("unsupported");
29     }
30
31     pub fn join(self) {
32         match self.0 {}
33     }
34 }
35
36 pub mod guard {
37     pub type Guard = !;
38     pub unsafe fn current() -> Option<Guard> { None }
39     pub unsafe fn init() -> Option<Guard> { None }
40 }
```

Thread is not supported in OP-TEE OS. Currently, we will raise a panic.

In the latest upstream Rust Standard Library, this can be a build time error.

Getting Started with QEMU

- Teaclave TrustZone SDK: <https://github.com/apache/incubator-teaclave-trustzone-sdk/blob/master/README.md>
- QEMU for ARMv8: <https://tealclave.apache.org/trustzone-sdk-docs/getting-started-with-optee-for-qemu-armv8/>

Getting Started with QEMU

- Clone the project and initialize related submodules

```
$ git clone git@github.com:mesalock-linux/rust-optee-trustzone-sdk.git  
$ cd rust-optee-trustzone-sdk  
$ git submodule update --init  
$ (cd rust/compiler-builtins && git submodule update --init libm compiler-rt)  
$ (cd rust/rust && git submodule update --init src/stdsimd)
```

Getting Started with QEMU

- Clone the project and initialize related submodules
- Install dependencies
- Use Docker instead

```
$ docker build -t rust-optee-trustzone-sdk - < Dockerfile
```

```
$ docker run --rm -it -v$(pwd) :/rust-optee-trustzone-sdk \
-w /rust-optee-trustzone-sdk rust-optee-trustzone-sdk
```

Build Examples

```
$ make optee  
$ source environment  
$ make examples
```

Getting Started with QEMU

- Download OP-TEE for QEMU ARMv8 source code.
- Build OP-TEE for QEMU ARMv8 and images.

```
$ docker run --rm -it -v$(pwd):/rust-optee-trustzone-sdk \
-w /rust-optee-trustzone-sdk \
mesalocklinux/rust-optee-trustzone-sdk-qemuuv8-ci \
bash -c "cd ci && ./ci_hello_world.sh"
```

- Login (username: root) and Mount shared folder in QEMU guest system.
- Copy TAs to corresponding directory.

Example - Demo in QEMU

The screenshot shows a dual-terminal window in QEMU. The left terminal is titled "Activities" and displays a log of TrustZone Application (TA) operations:

```
[+] TA open session
[+] TA invoke command
[+] TA invoke command
D/TC:?: 0 tee_ta_close_session:380 tee_ta_close_session(0xe165630)
D/TC:?: 0 tee_ta_close_session:399 Destroy session
[+] TA close session
[+] TA destroy
D/TC:?: 0 tee_ta_close_session:425 Destroy TA context
D/TC:?: 0 tee_ta_init_pseudo_ta_session:276 Lookup pseudo TA 2f61a5e4-cf30-411d-a3e2-1f162bcb94a8
D/TC:?: 0 load_elf:827 Lookup user TA ELF 2f61a5e4-cf30-411d-a3e2-1f162bcb94a8 (Secure Storage TA)
D/TC:?: 0 load_elf:827 Lookup user TA ELF 2f61a5e4-cf30-411d-a3e2-1f162bcb94a8 (REE)
D/TC:?: 0 load_elf_from_store:795 ELF load address 0x40006000
D/TC:?: 0 tee_ta_init_user_ta_session:1017 Processing relocations in 2f61a5e4-cf30-411d-a3e2-1f162bcb94a8
[+] TA create
[+] TA open session
[+] TA invoke command
serialized = {"x":1,"y":2}
deserialized = Point { x: 1, y: 2 }

D/TC:?: 0 tee_ta_close_session:399 Destroy session
[+] TA close session
[+] TA destroy
D/TC:?: 0 tee_ta_close_session:425 Destroy TA context
```

The right terminal is titled "Normal" and shows the execution of a Rust program:

```
# ls
aes          hotp
hello_world  random
secure_storage
serde

# ./hello_world
original value is 29
inc value is 129
dec value is 29
Success
# ./serde
Point { x: 1, y: 2 }
Success
#
```

Example - Client (Initial Design)

```
92 lines (82 sloc) 2.5 KB
Raw Blame History ⚙️ 🎯

20     DecValue,  
21     Unknown,  
22 }  
23  
24 impl From<u32> for Command {  
25     #[inline]  
26     fn from(value: u32) -> Command {  
27         match value {  
28             0 => Command::IncValue,  
29             1 => Command::DecValue,  
30             _ => Command::Unknown,  
31         }  
32     }  
33 }  
34  
35 pub const UUID: &str = &include_str!(concat!(env!("OUT_DIR"), "/uuid.txt"));
```

Command/UUID shared with host and TA.

Statically include the UUID str.

Example - Project Structure

- **host/**: source code of the client app
- **ta/**: source code of TA
 - **ta.lds**: linker script
 - **xargo.toml**: "Cargo.toml" for cross compilation
 - **ta_static.rs**: some static data structure for TA
- **proto/**: shared data structure and configurations like a protocol
- **Makefile**: Makefile to build host and client
- **uuid.txt**: UUID for TA, randomly generated if the file does not exist.

arm-unknown-linux-gnu
aarch64-unknown-linux-gnu

arm-unknown-optee-trustzone
aarch64-unknown-optee-trustzone

Example - Use Serde

```
1 [package]
2 name = "ta"
3 version = "0.1.0"
4 authors = ["The Rust OP-TEE TrustZone SDK Project Developers"]
5 license = "Apache-2.0"
6 repository = "https://github.com/mesalock-linux/rust-optee-trustzone-sdk.git"
7 description = "An example of Rust OP-TEE TrustZone SDK."
8 edition = "2018"
9
10 [dependencies]
11 libc = { path = "../../rust/libc" }
12 optee-utee-sys = { path = "../../optee-utee/optee-utee-sys" }
13 optee-utee = { path = "../../optee-utee" }
14 serde = { version = "1.0", features = ["derive"] }
15 serde_json = "1.0"
16
17 [build_dependencies]
18 uuid = { version = "0.7", features = ["v4"] }
```

serde / serde_json

Example - Use Serde

```
37 #[ta_invoke_command]
38 fn invoke_command(cmd_id: u32, _params: &mut Parameters) -> Result<()> {
39     trace_println!("[+] TA invoke command");
40     match Command::from(cmd_id) {
41         Command::DefaultOp => {
42             let point = Point { x: 1, y: 2 };
43
44             // Convert the Point to a JSON string.
45             let serialized = serde_json::to_string(&point).unwrap();
46
47             // Prints serialized = {"x":1,"y":2}
48             trace_println!("serialized = {}", serialized);
49
50             // Convert the JSON string back to a Point.
51             let deserialized: Point = serde_json::from_str(&serialized).unwrap();
52
53             // Prints deserialized = Point { x: 1, y: 2 }
54             trace_println!("deserialized = {:?}", deserialized);
55
56             Ok(())
57         }
58         _ => Err(Error::new(ErrorKind::BadParameters)),
59     }
60 }
```

Use `serde` to handle invoke command

Example - Message Passing Interface (Proto)

```
18  use serde::{Serialize, Deserialize};  
19  pub use serde_json;  
20  
21 #[derive(Serialize, Deserialize, Debug, Copy, Clone)]  
22 pub enum Command {  
    Hello,  
    Bye,  
    Unknown,  
}  
27  
28 #[derive(Serialize, Deserialize, Debug)]  
29 pub struct EnclaveInput {  
    pub command: Command,  
    pub message: String  
}  
33  
34 #[derive(Serialize, Deserialize, Debug)]  
35 pub struct EnclaveOutput {  
    pub message: String  
}  
38  
39 impl From<u32> for Command {  
40     #[inline]  
41     fn from(value: u32) -> Command {  
42         match value {  
43             0 => Command::Hello,  
44             1 => Command::Bye,  
45             _ => Command::Unknown,  
46         }  
47     }  
48 }
```

Protocol

Example - Message Passing Interface (Host)

```
50     pub fn invoke(&mut self, input: &proto::EnclaveInput) -> Result<proto::EnclaveOutput> {
51         let command_id = input.command as u32;
52         let mut serialized_input = proto::serde_json::to_vec(input).unwrap();
53
54         let p0 = ParamTmpRef::new_input(serialized_input.as_mut_slice());
55         let p1 = ParamTmpRef::new_output(&mut self.buffer);
56         let p2 = ParamValue::new(0, 0, ParamType::ValueInout);
57
58         let mut operation = Operation::new(0, p0, p1, p2, ParamNone);
59
60         let uuid = Uuid::parse_str(&self.uuid).unwrap();
61         let mut session = self.context.open_session(uuid)?;
62         session.invoke_command(command_id, &mut operation)?;
63         let len = operation.parameters().2.a() as usize;
64
65         let output: proto::EnclaveOutput = proto::serde_json::from_slice(&self.buffer[0..len]).unwrap();
66         Ok(output)
67     }
68 }
69
70 fn main() -> optee_teec::Result<()> {
71     let url = format!("trustzone-enclave://{}", proto::UUID);
72     let mut enclave = EnclaveClient::open(&url).unwrap();
73     let input = proto::EnclaveInput {
74         command: proto::Command::Hello,
75         message: String::from("World!")
76     };
77     let output = enclave.invoke(&input).unwrap();
78     println!("{}: {:?}", output);
79
80     Ok(())
81 }
```

Invoke Command::Hello with
EnclaveInput

Example - Message Passing Interface (TA)

```
27 fn handle_invoke(command: Command, input: proto::EnclaveInput) -> Result<proto::EnclaveOutput> {
28     match command {
29         Command::Hello => {
30             let output = proto::EnclaveOutput {
31                 message: format!("Hello, {}", input.message)
32             };
33             Ok(output)
34         },
35         Command::Bye => {
36             let output = proto::EnclaveOutput {
37                 message: format!("Bye, {}", input.message)
38             };
39             Ok(output)
40         },
41         _ => Err(Error::new(ErrorKind::BadParameters)),
42     }
43 }
```

Return proto::EnclaveOutput.

- **serde**: Rust third-party crates for de/serialization

Documents & Wiki

Struct optee_tee::Context

[+] Show declaration
[-] An abstraction of the logical connection between a client application and a TEE.

Methods

- [-] `impl Context`
- [-] `pub fn new() -> Result<Context>`
Creates a TEE client context object.

Examples

```
let ctx = Context::new().unwrap();
```

[-] `pub fn new_raw(fd: c_int, reg_mem: bool) -> Result<TEC_Context>`
Creates a raw TEE client context with implementation defined parameters.

Examples

```
let raw_ctx: optee_tec_sys::TEEC_Context = Context::new_raw(0, true);
```

[-] `pub fn as_mut_raw_ptr(&mut self) -> *mut TEEC_Context`
Converts a TEE client context to a raw pointer.

Examples

```
let mut ctx = Context::new().unwrap();
let mut raw_ptr: *mut optee_tec_sys::TEEC_Context = ctx.as_mut_raw_ptr();
```

[-] `pub fn open_session(&mut self, uuid: Uuid) -> Result<Session>`
Opens a new session with the specified trusted application.
The target trusted application is specified by `uuid`.

Examples

```
let mut ctx = Context::new().unwrap();
let uuid = Uuid::parse_str("8abcf200-2450-11e4-abe2-0002a5d5c51b");
let session = ctx.open_session(uuid).unwrap();
```

Enums

- [-] `pub fn open_session_with_operation(&mut self, uuid: Uuid, operation: Operation) -> Result<Session>`
Opens a new session with the specified trusted application, pass some parameters to TA by a parameter object.
The target trusted application is specified by `uuid`.

Examples

```
let mut ctx = Context::new().unwrap();
let uuid = Uuid::parse_str("8abcf200-2450-11e4-abe2-0002a5d5c51b");
let p0 = Parameter::from_value(42, 0, ParamType::ValueInout);
let p1 = Parameter::new();
let p2 = Parameter::new();
let p3 = Parameter::new();
let mut operation = Operation::new(0, p0, p1, p2, p3);
let session = ctx.open_session_with_operation(uuid, operation).unwrap();
```

Getting started with OPTEE for QEMU ARMv8

Mingshen Sun edited this page 21 hours ago · 2 revisions

To run examples on the QEMU ARMv8 emulator, we need first build OP-TEE for QEMU ARMv8. You can install dependencies with this [instruction](#) or use our [Dockerfile](#).

Download OP-TEE for QEMU ARMv8 source code.

```
$ mkdir -p ~/bin
$ curl https://storage.googleapis.com/git-repo-downloads/repo > ~/bin/repo && chmod a+x ~/bin/repo
$ export PATH=~/bin:$PATH
$ mkdir optee-qemu-v8-3.4.0 && cd optee-qemu-v8-3.4.0 && \
repo init -q -u https://github.com/OP-TEE/manifest.git -m qemu_v8.xml -b 3.4.0 && \
repo sync -j4 --no-clone-bundle
```

Build OP-TEE for QEMU ARMv8 and images.

```
$ cd build && \
make -j2 toolchains && \
make QEMU_VIRTFS_ENABLE=y CFG_TEE_RAM_VA_SIZE=0x00300000 -j$(nproc)
```

Create a shared folder to share example host apps and TAs with QEMU guest system.

```
$ mkdir shared_folder
$ cp ALL_HOST_APPS_TAS shared_folder/
```

Run QEMU.

```
$ make run-only QEMU_VIRTFS_ENABLE=y QEMU_VIRTFS_HOST_DIR=$(pwd)/shared_folder
```

Mount shared folder in QEMU guest system (username: root).

```
$ mkdir shared && mount -t 9p -o trans=virtio host shared
```

Copy TAs to corresponding directory.

```
$ cd shared && cp *.ta /lib/optee_armitz/
```

Execute host apps.

```
$ ./hello_world
original value is 29
inc value is 129
dec value is 29
Success
```

Note that if you are under a environment without GUI, you please comment out the following code in `qemu_v8.mk` and use `nc` instead.

```
diff --git a/qemu_v8.mk b/qemu_v8.mk
index 8271590..1c4a91b 100644
--- a/qemu_v8.mk
+++ b/qemu_v8.mk
@@ -163,9 +163,9 @@ run-only:
    ln -sf $(ROOT)/out-br/images/rootfs.cpio.gz $(BINARIES_PATH)/
    $(call check-terminal)
    $(call run-help)
-   $(call launch-terminal,54320,"Normal World")
-   $(call launch-terminal,54321,"Secure World")
-   $(call wait-for-ports,54320,54321)
+   # $(call launch-terminal,54320,"Normal World")
+   # $(call launch-terminal,54321,"Secure World")
+   # $(call wait-for-ports,54320,54321)
    cd $(BINARIES_PATH) && $(QEMU_PATH)/aarch64-softmmu/qemu-system-aarch64 \
        -nographic \
        -serial tcp:localhost:54320 -serial tcp:localhost:54321
```

Before start QEMU, run two `nc` to listen port 54320 and 54321.

```
$ nc -l 127.0.0.1 54320
$ nc -l 127.0.0.1 54321
```

Then open QEMU by `make run-only`, and start by input `c`.

Test

- **ctest**: Automated testing of FFI bindings in Rust. This repository is intended to validate the `*-sys` crates that can be found on crates.io to ensure that the APIs in Rust match the APIs defined in C.
- QEMU integration tests, no unit tests for now
- Travis CI

Run/Test Examples in QEMU

```
$ docker run --rm -it \
-v$(pwd):/rust-optee-trustzone-sdk \
-w /rust-optee-trustzone-sdk \
mesalocklinux/rust-optee-trustzone-sdk-qemuuv8-ci \
bash -c "cd ci && ./ci_hello_world.sh"
```

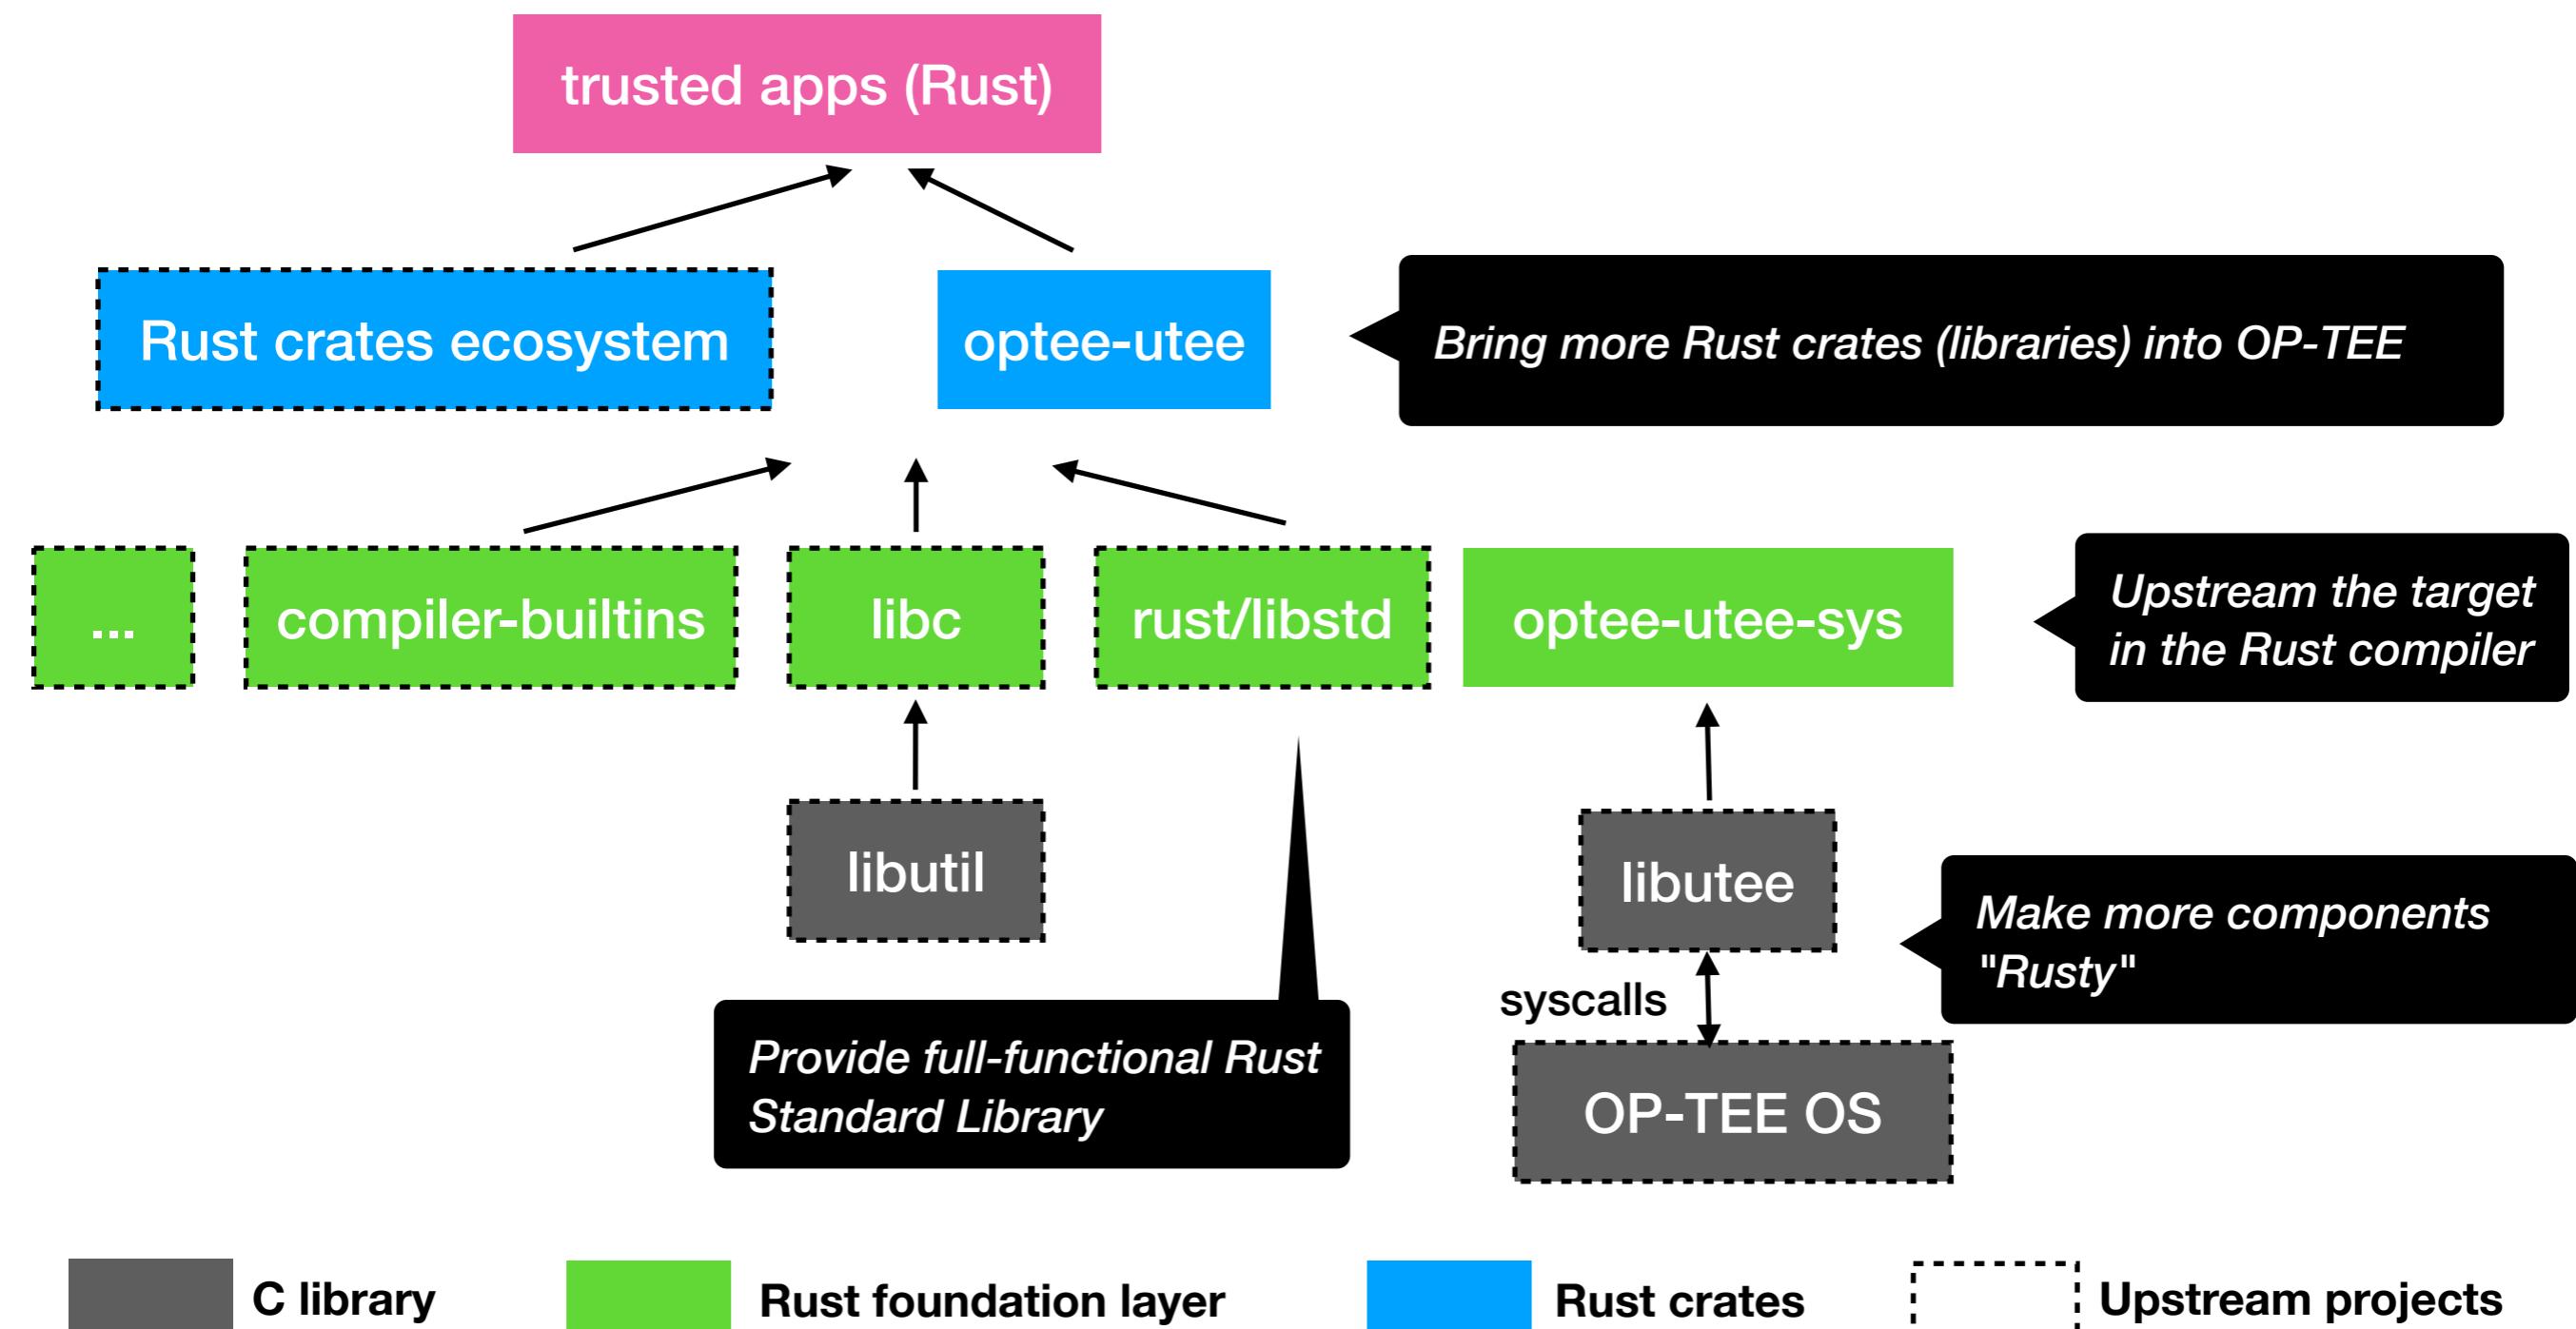

Powered by

- **Baidu:** Smart IoT, Self-driving Car, Cloud
- **Veracruz:** A framework for defining and deploying collaborative, privacy-preserving computations amongst a group of mutually mistrusting individuals.

Roadmap for Teaclave TrustZone SDK

- Bring more Rust crates (libraries) into OP-TEE
- Upstream the target in the Rust compiler
- Make more components "Rusty"
- Provide full-functional Rust Standard Library

Roadmap

Thanks!
